

Note: Governing Equations of General 3D duct flow

Email: jiaqi_wang@sjtu.edu.cn

I. Hard-walled cylindrical ducts as basis function

A. Infinite straight duct mode

We began from the Helmholtz equation:

$$\nabla^2 \psi = \frac{1}{r} \frac{\partial}{\partial r} \left(r \frac{\partial \psi}{\partial r} \right) + \frac{1}{r^2} \frac{\partial^2 \psi}{\partial \theta^2} = -\alpha^2 \psi \quad (1)$$

Using separation of variables, Circular symmetry: modes have the form : $\psi = F(r)G(\theta)$,

Then we have:

$$\begin{aligned} \left(\frac{\partial^2 F}{\partial r^2} + \frac{1}{r} \frac{\partial F}{\partial r} \right) G + \frac{F}{r^2} \frac{\partial^2 G}{\partial \theta^2} &= -\alpha^2 FG \\ \text{Then,} \\ \frac{\left(\frac{\partial^2 F}{\partial r^2} + \frac{1}{r} \frac{\partial F}{\partial r} \right)}{F} + \frac{1}{r^2} \frac{\frac{\partial^2 G}{\partial \theta^2}}{G} &= -\alpha^2 \end{aligned} \quad (2)$$

We assume that:

Due to periodicity, we require that Φ satisfy,

$$\frac{d^2 G}{d\theta^2} = -m^2 G \rightarrow \Phi(\theta) = e^{\pm im\theta} \quad (3)$$

Thus, we have

$$F'' + \frac{1}{r} F' + \left(\alpha^2 - \frac{m^2}{r^2} \right) F = 0 \rightarrow F(r) = J_m(\alpha r) \quad (4)$$

Circular symmetry $\psi = F(r)G(\theta)$: modes explicitly given by:

$$\psi = J_m(\alpha_{m\mu} r) e^{\pm im\theta} \quad (5)$$

Hard walls:

$$J'_m(\alpha R) = 0 \rightarrow \alpha_{m\mu} = \frac{j'_{m\mu}}{R} \quad (6)$$

Soft walls without flow:

$$Z\alpha_{m\mu}J'_m(\alpha_{m\mu}R) = -iw\rho_0J_m(\alpha_{m\mu}R) \rightarrow \alpha_{m\mu}(Z) \quad (7)$$

Soft walls with flow:

$$Z\alpha_{m\mu}J'_m(\alpha_{m\mu}R) = (w - U_0\kappa_{m\mu})J_m(\alpha_{m\mu}R) \rightarrow \alpha_{m\mu}(Z) \quad (8)$$

A complete solution may be writtern as:

$$p(x, r, \theta) = \sum_{m=-\infty}^{\infty} \sum_{\mu=1}^{\infty} (A_{m\mu}e^{-i\kappa_{m\mu}x} + B_{m\mu}e^{i\kappa_{m\mu}x})U_{m\mu}(r)e^{im\phi} \quad (9)$$

In a hard-walled duct $U_{m\mu}e^{-im\theta}$ are orthogonal. Normalise such that:

$$\int_0^{2\pi} \int_0^R U_{m\mu}(r)e^{-im\theta}U_{nv}(r)e^{-in\theta}rdr = 2\pi\delta_{\mu v}\delta_{mn} \quad (10)$$

Source expansion If $p(0, t, \theta) = p_0(r, \theta)$ is source in hard-walled duct, then for $x > 0$

$$\begin{aligned} p_0(r, \theta) &= \sum_{m=-\infty}^{\infty} \sum_{\mu=1}^{\infty} (A_{m\mu}e^{-i\kappa_{m\mu}0})U_{m\mu}(r)e^{-im\theta} \\ p_0(r, \theta)\underline{U_{nv}(r)e^{-in\theta}r} &= \sum_{m=-\infty}^{\infty} \sum_{\mu=1}^{\infty} (A_{m\mu}e^{-i\kappa_{m\mu}0})U_{m\mu}(r)e^{-im\theta}\underline{U_{nv}(r)e^{-in\theta}r} \\ \underline{\int_0^{2\pi} \int_0^R p_0(r, \theta)\underline{U_{nv}(r)e^{-in\theta}r}drd\theta} &= \underline{\int_0^{2\pi} \int_0^R \sum_{m=-\infty}^{\infty} \sum_{\mu=1}^{\infty} (A_{m\mu}e^{-i\kappa_{m\mu}0})U_{m\mu}(r)e^{-im\theta}\underline{U_{nv}(r)e^{-in\theta}r}drd\theta} \\ \underline{\int_0^{2\pi} \int_0^R p_0(r, \theta)\underline{U_{nv}(r)e^{-in\theta}r}drd\theta} &= \sum_{m=-\infty}^{\infty} \sum_{\mu=1}^{\infty} A_{m\mu} \underline{\int_0^{2\pi} \int_0^R U_{m\mu}(r)e^{-im\theta}\underline{U_{nv}(r)e^{-in\theta}r}drd\theta} \\ A_{nv} &= \frac{1}{2\pi} \underline{\int_0^{2\pi} \int_0^R p_0(r, \theta)\underline{U_{nv}(r)e^{-in\theta}r}drd\theta} \end{aligned} \quad (11)$$

and $B_{nv} = 0$. The same for $x < 0$ with A_{nv} and B_{nv} interchanged.

A finite number of modes (cut-on modes) survive at large distances. Just 1 mode if $kR \ll 1$: only A_{01} important.

B. General duct mode

The pressure and velocity can now be expressed as Fourier series. Upper indices shall be used to denote temporal decompositions:

$$\begin{aligned}
\hat{p} &= \sum_{a=-\infty}^{\infty} P^a(\mathbf{x})e^{-ia\omega t} \\
\hat{u} &= \sum_{a=-\infty}^{\infty} U^a(\mathbf{x})e^{-ia\omega t} \\
\hat{v} &= \sum_{a=-\infty}^{\infty} V^a(\mathbf{x})e^{-ia\omega t} \\
\hat{w} &= \sum_{a=-\infty}^{\infty} W^a(\mathbf{x})e^{-ia\omega t}
\end{aligned} \tag{12}$$

$$\begin{aligned}
P^a &= \sum_{\alpha=0}^{\infty} P_{\alpha m \mu}^a(s) \psi_{\alpha m \mu}(s, r, \theta) = \sum_{m=-\infty}^{\infty} \sum_{\mu=1}^{\infty} P_{\alpha m \mu}^a(s) \psi_{\alpha m \mu}(s, r, \theta) \\
U^a &= \sum_{\alpha=0}^{\infty} U_{\alpha m \mu}^a(s) \psi_{\alpha m \mu}(s, r, \theta) = \sum_{m=-\infty}^{\infty} \sum_{\mu=1}^{\infty} U_{\alpha m \mu}^a(s) \psi_{\alpha m \mu}(s, r, \theta) \\
V^a &= \sum_{\alpha=0}^{\infty} V_{\alpha m \mu}^a(s) \psi_{\alpha m \mu}(s, r, \theta) = \sum_{m=-\infty}^{\infty} \sum_{\mu=1}^{\infty} V_{\alpha m \mu}^a(s) \psi_{\alpha m \mu}(s, r, \theta) \\
W^a &= \sum_{\alpha=0}^{\infty} W_{\alpha m \mu}^a(s) \psi_{\alpha m \mu}(s, r, \theta) = \sum_{m=-\infty}^{\infty} \sum_{\mu=1}^{\infty} W_{\alpha m \mu}^a(s) \psi_{\alpha m \mu}(s, r, \theta)
\end{aligned} \tag{13}$$

1. Discussion of property of ψ

In Jams's thesis, $\psi_{\alpha} = C_{\alpha m \mu} J_m(\frac{j'_{m \mu} r}{h}) \cos(m\phi - \xi\pi/2)$. As he mentioned, it was merely a matter of preference - I find it easier to visualise the modes as being "symmetric" and "anti-symmetric" along the plane of torsion free ducts, but the other method is equally as valid.

However, there still a problem, which may cause error, but is not mentioned in the thesis:

$$\int_0^{2\pi} \cos(m\phi - \xi\pi/2)^2 d\theta = \frac{1 + \cos(2m\phi - \xi\pi)}{2} \Big|_0^{2\pi} = \begin{cases} \pi, m \neq 0 \\ 2\pi, m = 0, \xi = 0 \\ 0, m = 0, \xi = 1 \end{cases} \tag{14}$$

In the note, we try to introduce the common solution of ψ may have the form the same as the hard walls modes:

$$\psi_{m\mu}(r) = C_{\alpha m \mu} J_m(\frac{j'_{m \mu} r}{h}) e^{im\phi} \tag{15}$$

where may be normalized according to:

$$\int_0^{2\pi} \int_0^h \psi_{\alpha m \mu} \psi_{\beta n \nu} r dr d\theta = \delta_{\mu\nu} \delta_{mn} \tag{16}$$

In fact, we know that:

$$\begin{aligned} \int_0^{2\pi} e^{im\phi} e^{im\phi} d\theta &= 0 \\ \int_0^{2\pi} e^{im\phi} e^{-im\theta} d\theta &= 2\pi \end{aligned} \quad (17)$$

The orthogonality relation of Bessel function, with $J_{-m}(z) = (-1)^m J_m(z)$

$$\begin{aligned} \int_0^h r J_m\left(\frac{j'_{m\mu} r}{h}\right) J_m\left(\frac{j'_{mv} r}{h}\right) dr &= 0, \mu \neq v \\ \int_0^h r J_m\left(\frac{j'_{m\mu} r}{h}\right) J_{-m}\left(\frac{j'_{-mv} r}{h}\right) dr & \\ = (-1)^m \int_0^h r J_m\left(\frac{j'_{m\mu} r}{h}\right) J_m\left(\frac{j'_{mv} r}{h}\right) dr &= 0, \mu \neq v \end{aligned} \quad (18)$$

That changes our idea of normalization to:

$$\underline{\underline{\int_0^{2\pi} \int_0^h \psi_{\alpha_{m\mu}} \psi_{\beta_{nv}} r dr d\theta = (-1)^m \delta_{\mu v} \delta_{m, -n}}} \quad (19)$$

C. Normalised Modes $\rightarrow C_{\alpha_{m\mu}}$

Relation involving integrals:

$$\begin{aligned} & \frac{2 \int \alpha^2 x J_m(\alpha x)^2 dx = (\alpha^2 x^2 - m^2) J_m(\alpha x)^2 + \alpha^2 x^2 J'_m(\alpha x)^2}{\rightarrow 2 \int_0^h \alpha^2 x J_m(\alpha x)^2 dx = [(\alpha^2 x^2 - m^2) J_m(\alpha x)^2 + \alpha^2 x^2 J'_m(\alpha x)^2]_0^h} \\ &= [(\alpha^2 x^2 - m^2) J_m(\alpha x)^2 + \alpha^2 x^2 J'_m(\alpha x)^2]_h - [(\alpha^2 x^2 - m^2) J_m(\alpha x)^2 + \alpha^2 x^2 J'_m(\alpha x)^2]_0 \\ &= [(\alpha^2 h^2 - m^2) J_m(\alpha h)^2 + \alpha^2 h^2 J'_m(\alpha h)^2] - [(\alpha^2 0^2 - m^2) J_m(\alpha 0)^2 + \alpha^2 0^2 J'_m(\alpha 0)^2] \\ &= (\alpha^2 h^2 - m^2) J_m(\alpha h)^2 + \alpha^2 h^2 J'_m(\alpha h)^2 \end{aligned} \quad (20)$$

With hard-walled boudary condition:

$$J'_m(\alpha h) = 0 \rightarrow \alpha_{m\mu} = \frac{j'_{m\mu}}{h} (\text{eigenvalues}) \quad (21)$$

Then, we have(ref: Rienstra-Fundamentals of Duct Acoustics-(55)):

$$\begin{aligned} \int_0^h r J_m(\alpha r) J_{-m}(\alpha r) dr &= (-1)^m \int_0^h r J_m(\alpha r)^2 dr \\ &= (-1)^m \frac{1}{2\alpha_{m\mu}^2} (\alpha_{m\mu}^2 h^2 - m^2) J_m(\alpha_{m\mu} h)^2 \\ &= (-1)^m \left(\frac{J_m(\alpha_{m\mu} h) \sqrt{(h^2 - \frac{m^2}{\alpha_{m\mu}^2})}}{\sqrt{2}} \right)^2 \\ &= (-1)^m \left(\frac{h^2}{2} \left(1 - \frac{m^2}{j'^2_{m\mu}} \right) J_m^2(j'_{m\mu}) \right) \end{aligned} \quad (22)$$

Thus, with $\int_0^{2\pi} e^{im\phi} e^{-im\theta} d\theta = 2\pi$, $\psi_{\alpha_{m\mu}}(r) = C_{\alpha_{m\mu}} J_m(\frac{j'_{m\mu} r}{h}) e^{im\phi}$, we have:

$$C_{\alpha_{m\mu}} = \frac{i^m}{\sqrt{(\pi h^2 (1 - \frac{m^2}{j'^2_{m\mu}}) J_m^2(j'_{m\mu}))}} \quad (23)$$

except for : $C_{\alpha_{01}} = \frac{1}{\sqrt{\pi h}}$

$$\text{for } \int_0^{2\pi} \int_0^h \psi_{\alpha_{m\mu}} \psi_{\beta_{nv}} r dr d\theta = \delta_{\mu\nu} \delta_{m,-n} = \hat{\delta}_{\alpha\beta} = I.$$

D. Slowly varying ducts

waiting for updating.....

E. Orthogonal-eigenvector

ref:https:

www.mathworks.com/help/matlab/ref/eigs.html

Eigenvectors, returned as a matrix. The columns in V correspond to the eigenvalues along the diagonal of D. The form and normalization of V depends on the combination of input arguments:

[V,D] = eigs(A) returns matrix V, whose columns are the eigenvectors of A such that $A^*V = V^*D$. The eigenvectors in V are normalized so that the 2-norm of each is 1.

If A is symmetric, then the eigenvectors, V, are orthonormal.

[V,D] = eigs(A,B) returns V as a matrix whose columns are the generalized eigenvectors that satisfy $A^*V = B^*V^*D$. The 2-norm of each eigenvector is not necessarily 1.

If B is symmetric positive definite, then the eigenvectors in V are normalized so that the B-norm of each is 1. If A is also symmetric, then the eigenvectors are B-orthonormal.

We could further study this question!!

if we can use the GramSchmidt mode as basis??

II. Mass equation

Mass consevation:

$$-ia\kappa P^a + \nabla \cdot \mathbf{U}^a = \sum_{b=-\infty}^{+\infty} (-P^{a-b} \nabla \cdot \mathbf{U}^b - \mathbf{U}^{a-b} \cdot \nabla P^b - \frac{B}{2A} ia\kappa P^b P^{a-b}) \quad (24)$$

First, derivation of eq1:

We know that:

$$h_s = 1 - \kappa r \cos(\phi), h_r = 1, h_\theta = r \quad (25)$$

Then,

$$\begin{aligned} \nabla \cdot \mathbf{U}^a &= \frac{1}{h_1 h_2 h_3} \left[\frac{\partial(v_1 h_2 h_3)}{\partial w_1} + \frac{\partial(v_2 h_3 h_1)}{\partial w_2} + \frac{\partial(v_3 h_1 h_2)}{\partial w_3} \right] \\ &= \frac{1}{r(1 - \kappa r \cos(\phi))} \left[\frac{\partial(U^a r)}{\partial s} + \frac{\partial(V^a r(1 - \kappa r \cos(\phi)))}{\partial r} + \frac{\partial(W^a(1 - \kappa r \cos(\phi)))}{\partial \theta} \right] \end{aligned} \quad (26)$$

Thus, we have the mass equation, approximate RHS by:

$$\begin{aligned} \nabla \cdot \mathbf{U}^b &= ib\kappa P^b + o(M^2) \\ \nabla P^b &= ib\kappa \mathbf{U}^b + o(M^2) \end{aligned} \quad (27)$$

Then we have

$$\begin{aligned} -iakP^a + \frac{1}{r(1 - \kappa r \cos(\phi))} \left[\frac{\partial(U^a r)}{\partial s} + \frac{\partial(V^a r(1 - \kappa r \cos(\phi)))}{\partial r} + \frac{\partial(W^a(1 - \kappa r \cos(\phi)))}{\partial \theta} \right] \\ = \sum_{b=-\infty}^{+\infty} (-ib\kappa P^{a-b} P^b - ib\kappa U^{a-b} U^b - ib\kappa V^{a-b} V^b - ib\kappa W^{a-b} W^b - \frac{B}{2A} iakP^b P^{a-b}) \end{aligned} \quad (28)$$

The fourier harmonics are expanded as follows:

$$\begin{aligned} P^a &= \sum_{\beta=0}^{\infty} P_\beta^a(s) \psi_\beta(s, r, \theta) \\ U^a &= \sum_{\beta=0}^{\infty} U_\beta^a(s) \psi_\beta(s, r, \theta) \\ V^a &= \sum_{\beta=0}^{\infty} V_\beta^a(s) \psi_\beta(s, r, \theta) \\ W^a &= \sum_{\beta=0}^{\infty} W_\beta^a(s) \psi_\beta(s, r, \theta) \end{aligned} \quad (29)$$

with normalized relation:

$$\int_0^{2\pi} \int_0^h \psi_\alpha \psi_\beta r dr d\theta = \hat{\delta}_{\alpha\beta} \quad (30)$$

Reorganize the eq5:

$$\begin{aligned} -iakP^a(1 - \kappa r \cos(\phi)) + \frac{1}{r} \frac{\partial(U^a r)}{\partial s} + \frac{1}{r} \frac{\partial(V^a r(1 - \kappa r \cos(\phi)))}{\partial r} + \frac{1}{r} \frac{\partial(W^a(1 - \kappa r \cos(\phi)))}{\partial \theta} \\ = (1 - \kappa r \cos(\phi)) \sum_{b=-\infty}^{+\infty} (-ib\kappa P^{a-b} P^b - ib\kappa U^{a-b} U^b - ib\kappa V^{a-b} V^b - ib\kappa W^{a-b} W^b - \frac{B}{2A} iakP^b P^{a-b}) \end{aligned} \quad (31)$$

Intergal and insert eq 6, 7 into eq 8:

1. the first term:

$$\begin{aligned}
& \int_0^{2\pi} \int_0^h \psi_\alpha r [-ia\kappa(1 - \kappa r \cos(\phi)) P^a] dr d\theta \\
&= -ia\kappa \sum_{\beta=0}^{\infty} \int_0^{2\pi} \int_0^h \psi_\alpha \psi_\beta r [(1 - \kappa r \cos(\phi))] dr d\theta P_\beta^a \\
&\Rightarrow -ia\kappa \Psi_{\alpha\beta} [r(1 - \kappa \cos(\phi))] P_\beta^a \\
&\quad (summation convention)
\end{aligned} \tag{32}$$

2. the second term:

From 1.1 as example, we know that

$$\begin{aligned}
& \int_0^{2\pi} \int_0^h \frac{\partial}{\partial s} [r U^{a-b} U^b \psi_\alpha] dr d\theta \\
&= \frac{\partial}{\partial s} \int_0^{2\pi} \int_0^h [r U^{a-b} U^b \psi_\alpha] dr d\theta - \int_0^{2\pi} \frac{dh(s)}{ds} [r U^{a-b} U^b \psi_\alpha]_{r=h} d\theta
\end{aligned} \tag{33}$$

$$\frac{d}{d\alpha} \left(\int_{a(\alpha)}^{b(\beta)} f(x, \alpha) dx \right) - 0 + \frac{da(\alpha)}{d\alpha} f(a(\alpha), \alpha) = \int_{a(\alpha)}^{b(\beta)} \frac{\partial}{\partial \alpha} f(x, \alpha) dx \tag{34}$$

$$\begin{aligned}
& \int_0^{2\pi} \int_0^h \psi_\alpha r \left[\frac{1}{r} \frac{\partial(U^a r)}{\partial s} \right] dr d\theta \\
&= \sum_{\beta=0}^{\infty} \int_0^{2\pi} \int_0^h \psi_\alpha r \frac{\partial(\psi_\beta U_\beta^a)}{\partial s} dr d\theta \\
&= \int_0^{2\pi} \int_0^h \psi_\alpha \psi_\beta r \frac{\partial(U_\beta^a)}{\partial s} dr d\theta + \int_0^{2\pi} \int_0^h \psi_\alpha r \frac{\partial(\psi_\beta)}{\partial s} dr d\theta U_\beta^a \\
&= \int_0^{2\pi} \int_0^h \frac{\partial \psi_\alpha \psi_\beta r U_\beta^a}{\partial s} dr d\theta - \int_0^{2\pi} \int_0^h \frac{\partial \psi_\alpha \psi_\beta r}{\partial s} U_\beta^a dr d\theta \\
&\quad + \int_0^{2\pi} \int_0^h r \frac{\partial(\psi_\alpha \psi_\beta)}{\partial s} dr d\theta U_\beta^a - \int_0^{2\pi} \int_0^h \psi_\beta r \frac{\partial(\psi_\alpha)}{\partial s} dr d\theta U_\beta^a \\
&= \sum_{\beta=0}^{\infty} \frac{\partial}{\partial s} \int_0^{2\pi} \int_0^h [\psi_\alpha \psi_\beta r U_\beta^a] dr d\theta - \sum_{\beta=0}^{\infty} \int_0^{2\pi} \frac{dh(s)}{ds} [\psi_\alpha \psi_\beta r U_\beta^a]_{r=h} d\theta \\
&\quad - \sum_{\beta=0}^{\infty} \int_0^{2\pi} \int_0^h \frac{\partial(\psi_\alpha)}{\partial s} \psi_\beta r dr d\theta U_\beta^a \\
&\Rightarrow \frac{d}{ds} (U_\beta^a \hat{\delta}_{\alpha\beta}) + 0(perioidic) - \Psi_{\{\alpha\}\beta} [r] U_\beta^a
\end{aligned} \tag{35}$$

mark:0(perioidic),which is similar in the follow momentum equation, but not eliminate in time.

3. the third term:

$$\begin{aligned}
& \int_0^{2\pi} \int_0^h \psi_\alpha r \left[\frac{1}{r} \frac{\partial(V^a r(1 - \kappa r \cos(\phi)))}{\partial r} \right] dr d\theta \\
&= \sum_{\beta=0}^{\infty} \int_0^{2\pi} \int_0^h \psi_\alpha \frac{\partial(\psi_\beta r(1 - \kappa r \cos(\phi)))}{\partial r} dr d\theta V_\beta^a \\
&= \int_0^{2\pi} \int_0^h \frac{\partial(\psi_\alpha \psi_\beta r(1 - \kappa r \cos(\phi)))}{\partial r} dr d\theta V_\beta^a - \int_0^{2\pi} \int_0^h \psi_\beta r(1 - \kappa r \cos(\phi)) \frac{\partial(\psi_\alpha)}{\partial r} dr d\theta V_\beta^a \\
&= 0(\text{periodic}) - \Psi_{[\alpha]\beta}[r(1 - \kappa r \cos(\phi))]V_\beta^a
\end{aligned} \tag{36}$$

4. the fourth term:

$$\begin{aligned}
& \int_0^{2\pi} \int_0^h \psi_\alpha r \left[\frac{1}{r} \frac{\partial(W^a(1 - \kappa r \cos(\phi)))}{\partial \theta} \right] dr d\theta \\
&= \sum_{\beta=0}^{\infty} \int_0^{2\pi} \int_0^h \psi_\alpha \left[\frac{\partial(\psi_\beta(1 - \kappa r \cos(\phi)))}{\partial \theta} \right] dr d\theta W_\beta^a \\
&= \int_0^{2\pi} \int_0^h \left[\frac{\partial(\psi_\alpha \psi_\beta(1 - \kappa r \cos(\phi)))}{\partial \theta} \right] dr d\theta W_\beta^a - \int_0^{2\pi} \int_0^h \psi_\beta(1 - \kappa r \cos(\phi)) \left[\frac{\partial(\psi_\alpha)}{\partial \theta} \right] dr d\theta W_\beta^a \\
&= \int_0^h [\psi_\alpha \psi_\beta(1 - \kappa r \cos(\phi))]_0^{2\pi} dr W_\beta^a - \int_0^{2\pi} \int_0^h \psi_\beta(1 - \kappa r \cos(\phi)) \left[\frac{\partial(\psi_\alpha)}{\partial \theta} \right] dr d\theta W_\beta^a \\
&= 0 - \Psi_{(\alpha)\beta}[(1 - \kappa r \cos(\phi))]W_\beta^a
\end{aligned} \tag{37}$$

5. the RHS term:

$$\begin{aligned}
& \int_0^{2\pi} \int_0^h \psi_\alpha r [(1 - \kappa r \cos(\phi)) \sum_{b=-\infty}^{+\infty} (-ib\kappa P^{a-b} P^b - ib\kappa U^{a-b} U^b - ib\kappa V^{a-b} V^b - ib\kappa W^{a-b} W^b - \frac{B}{2A} iak P^b P^{a-b})] dr d\theta \\
&= \sum_{\beta=0}^{\infty} \sum_{\gamma=0}^{\infty} \Psi_{\alpha\beta\gamma} [r(1 - \kappa r \cos(\phi))] \sum_{b=-\infty}^{+\infty} (-ib\kappa P_\beta^{a-b} P_\gamma^b - ib\kappa U_\beta^{a-b} U_\gamma^b - ib\kappa V_\beta^{a-b} V_\gamma^b - ib\kappa W_\beta^{a-b} W_\gamma^b - iak \frac{B}{2A} P_\beta^{a-b} P_\gamma^b) \\
&= \sum_{\beta=0}^{\infty} \sum_{\gamma=0}^{\infty} \Psi_{\alpha\beta\gamma} [r(1 - \kappa r \cos(\phi))] \sum_{b=-\infty}^{+\infty} (-ib\kappa P_\beta^{a-b} P_\gamma^b - ib\kappa U_\beta^{a-b} U_\gamma^b - ib\kappa V_\beta^{a-b} V_\gamma^b - ib\kappa W_\beta^{a-b} W_\gamma^b - iak \frac{B}{2A} P_\beta^{a-b} P_\gamma^b)
\end{aligned} \tag{38}$$

Finally, we obtain the mass equation in the form of eigenfunction, the idea is same as Galerkin method:

$$\begin{aligned}
& \frac{dU_\beta^a}{ds} \hat{\delta}_{\alpha\beta} - \Psi_{\{\alpha\}\beta}[r]U_\beta^a - iak\Psi_{\alpha\beta}[r(1 - \kappa r \cos(\phi))]P_\beta^a - \Psi_{[\alpha]\beta}[r(1 - \kappa r \cos(\phi))]V_\beta^a - \Psi_{(\alpha)\beta}[(1 - \kappa r \cos(\phi))]W_\beta^a \\
&= \Psi_{\alpha\beta\gamma}[r(1 - \kappa r \cos(\phi))] \sum_{b=-\infty}^{+\infty} (-ib\kappa P_\beta^{a-b} P_\gamma^b - ib\kappa U_\beta^{a-b} U_\gamma^b - ib\kappa V_\beta^{a-b} V_\gamma^b - ib\kappa W_\beta^{a-b} W_\gamma^b - iak \frac{B}{2A} P_\beta^{a-b} P_\gamma^b)
\end{aligned} \tag{39}$$

III. Momentum equation

Momentum consevation:

$$-ia\kappa\mathbf{U}^a + \nabla P^a = \sum_{b=-\infty}^{\infty} (-\mathbf{U}^{a-b} \cdot \nabla \mathbf{U}^b + P^{a-b} \nabla P^b) \quad (40)$$

First, we know that

$$\nabla P^a = \sum_i \frac{1}{h_i} \frac{\partial f}{\partial w_i} \hat{h}_i = \frac{1}{1 - \kappa r \cos \phi} \frac{\partial P^a}{\partial s} \hat{e}_s + \frac{\partial P^a}{\partial r} \hat{e}_r + \frac{1}{r} \frac{\partial P^a}{\partial \theta} \hat{e}_\theta \quad (41)$$

The RHS term is a bit complex, with the divergence of a vector \mathbf{U} with its gradient, with

First, we know that

$$(\mathbf{v} \cdot \nabla) \mathbf{v}^b = \begin{cases} term1 : \mathcal{D}v_1^b + \frac{v_2^b}{h_2 h_1} (v_1 \frac{\partial h_1}{\partial \xi_2} - v_2 \frac{\partial h_2}{\partial \xi_1}) + \frac{v_3^b}{h_3 h_1} (v_1 \frac{\partial h_1}{\partial \xi_3} - v_2 \frac{\partial h_3}{\partial \xi_1}) \\ term2 : \mathcal{D}v_2^b + \frac{v_3^b}{h_3 h_2} (v_2 \frac{\partial h_2}{\partial \xi_3} - v_3 \frac{\partial h_3}{\partial \xi_2}) + \frac{v_1^b}{h_1 h_2} (v_2 \frac{\partial h_2}{\partial \xi_1} - v_1 \frac{\partial h_1}{\partial \xi_2}) \\ term3 : \mathcal{D}v_3^b + \frac{v_1^b}{h_1 h_3} (v_3 \frac{\partial h_3}{\partial \xi_1} - v_1 \frac{\partial h_1}{\partial \xi_3}) + \frac{v_2^b}{h_2 h_3} (v_3 \frac{\partial h_3}{\partial \xi_2} - v_2 \frac{\partial h_2}{\partial \xi_3}) \end{cases} \quad (42)$$

Besides,

$$\mathcal{D} = \frac{v_1}{h_1} \frac{\partial}{\partial \xi_1} + \frac{v_2}{h_2} \frac{\partial}{\partial \xi_2} + \frac{v_3}{h_3} \frac{\partial}{\partial \xi_3} \quad (43)$$

Thus, we have:

$$\begin{aligned}
& -\mathbf{U}^{a-b} \cdot \nabla \mathbf{U}^b = \\
& - \sum_{b=-\infty}^{\infty} \left\{ \begin{aligned} & term\mathcal{D}1 : \frac{U^{a-b}}{1-\kappa r \cos \phi} \frac{\partial U^b}{\partial s} + V^{a-b} \frac{\partial U^b}{\partial r} + \frac{W^{a-b}}{r} \frac{\partial U^b}{\partial \theta} \\ & term\mathcal{D}2 : \frac{U^{a-b}}{1-\kappa r \cos \phi} \frac{\partial V^b}{\partial s} + V^{a-b} \frac{\partial V^b}{\partial r} + \frac{W^{a-b}}{r} \frac{\partial V^b}{\partial \theta} \\ & term\mathcal{D}3 : \frac{U^{a-b}}{1-\kappa r \cos \phi} \frac{\partial W^b}{\partial s} + V^{a-b} \frac{\partial W^b}{\partial r} + \frac{W^{a-b}}{r} \frac{\partial W^b}{\partial \theta} \end{aligned} \right. \\
& - \sum_{b=-\infty}^{\infty} \left\{ \begin{aligned} & term\mathcal{X}1 : \frac{V^b}{1-\kappa r \cos \phi} (U^{a-b} \frac{\partial(1-\kappa r \cos \phi)}{\partial r} - V^{a-b} \frac{\partial 1}{\partial s}) + \frac{W^b}{r(1-\kappa r \cos \phi)} (U^{a-b} \frac{\partial(1-\kappa r \cos \phi)}{\partial \theta} - V^{a-b} \frac{\partial r}{\partial s}) \\ & term\mathcal{X}2 : \frac{W^b}{r} (V^{a-b} \frac{\partial 1}{\partial \theta} - W^{a-b} \frac{\partial r}{\partial r}) + \frac{U^b}{(1-\kappa r \cos \phi)1} (V^{a-b} \frac{\partial 1}{\partial s} - U^{a-b} \frac{\partial(1-\kappa r \cos \phi)}{\partial r}) \\ & term\mathcal{X}3 : \frac{U^b}{(1-\kappa r \cos \phi)r} (W^{a-b} \frac{\partial h_3}{\partial s} - U^{a-b} \frac{\partial(1-\kappa r \cos \phi)}{\partial \theta}) + \frac{V^b}{1h_3} (W^{a-b} \frac{\partial h_3}{\partial r} - V^{a-b} \frac{\partial 1}{\partial \theta}) \end{aligned} \right. = \\
& \sum_{b=-\infty}^{\infty} \left\{ \begin{aligned} & term\mathcal{D}1 : -\frac{U^{a-b}}{1-\kappa r \cos \phi} \frac{\partial U^b}{\partial s} - V^{a-b} \frac{\partial U^b}{\partial r} - \frac{W^{a-b}}{r} \frac{\partial U^b}{\partial \theta} \\ & term\mathcal{D}2 : -\frac{U^{a-b}}{1-\kappa r \cos \phi} \frac{\partial V^b}{\partial s} - V^{a-b} \frac{\partial V^b}{\partial r} - \frac{W^{a-b}}{r} \frac{\partial V^b}{\partial \theta} \\ & term\mathcal{D}3 : -\frac{U^{a-b}}{1-\kappa r \cos \phi} \frac{\partial W^b}{\partial s} - V^{a-b} \frac{\partial W^b}{\partial r} - \frac{W^{a-b}}{r} \frac{\partial W^b}{\partial \theta} \end{aligned} \right. \\
& + \sum_{b=-\infty}^{\infty} \left\{ \begin{aligned} & term\mathcal{X}1 : \frac{\kappa \cos \phi}{1-\kappa r \cos \phi} U^{a-b} V^b - \frac{\kappa \sin \phi}{(1-\kappa r \cos \phi)} U^{a-b} W^b \\ & term\mathcal{X}2 : \frac{W^{a-b} W^b}{r} - \frac{\kappa \cos \phi}{(1-\kappa r \cos \phi)} U^{a-b} U^b \\ & term\mathcal{X}3 : \frac{\kappa \sin \phi}{(1-\kappa r \cos \phi)} U^{a-b} U^b - \frac{W^{a-b} V^b}{r} \end{aligned} \right. \quad (44)
\end{aligned}$$

Finally, we could derive the momentum conservation equation, with final term approximate by eq 4:

$$\begin{aligned}
& \left\{ \begin{aligned} & -ia\kappa U^a + \frac{1}{1-\kappa r \cos \phi} \frac{\partial P^a}{\partial s} \\ & -ia\kappa V^a + \frac{\partial P^a}{\partial r} \\ & -ia\kappa W^a + \frac{1}{r} \frac{\partial P^a}{\partial \theta} \end{aligned} \right. \\
& = \sum_{b=-\infty}^{\infty} \left\{ \begin{aligned} & term\mathcal{D}1 : -\frac{U^{a-b}}{1-\kappa r \cos \phi} \frac{\partial U^b}{\partial s} - V^{a-b} \frac{\partial U^b}{\partial r} - \frac{W^{a-b}}{r} \frac{\partial U^b}{\partial \theta} \\ & term\mathcal{D}2 : -\frac{U^{a-b}}{1-\kappa r \cos \phi} \frac{\partial V^b}{\partial s} - V^{a-b} \frac{\partial V^b}{\partial r} - \frac{W^{a-b}}{r} \frac{\partial V^b}{\partial \theta} \\ & term\mathcal{D}3 : -\frac{U^{a-b}}{1-\kappa r \cos \phi} \frac{\partial W^b}{\partial s} - V^{a-b} \frac{\partial W^b}{\partial r} - \frac{W^{a-b}}{r} \frac{\partial W^b}{\partial \theta} \end{aligned} \right. \quad (45) \\
& + \sum_{b=-\infty}^{\infty} \left\{ \begin{aligned} & term\mathcal{X}1 : \frac{\kappa \cos \phi}{1-\kappa r \cos \phi} U^{a-b} V^b - \frac{\kappa \sin \phi}{(1-\kappa r \cos \phi)} U^{a-b} W^b \\ & term\mathcal{X}2 : \frac{W^{a-b} W^b}{r} - \frac{\kappa \cos \phi}{(1-\kappa r \cos \phi)} U^{a-b} U^b \\ & term\mathcal{X}3 : \frac{\kappa \sin \phi}{(1-\kappa r \cos \phi)} U^{a-b} U^b - \frac{W^{a-b} V^b}{r} \end{aligned} \right. + \sum_{b=-\infty}^{\infty} \left\{ \begin{aligned} & ib\kappa P^{a-b} U^b \\ & ib\kappa P^{a-b} V^b \\ & ib\kappa P^{a-b} W^b \end{aligned} \right.
\end{aligned}$$

Now, we are going to project on ψ , it may be a little complex, we will doing step by step.

A. Momentum e^s term

First, deal with the e^s term:

$$\begin{aligned}
& -iakU^a + \frac{1}{1 - \kappa r \cos \phi} \frac{\partial P^a}{\partial s} \\
& = \sum_{b=-\infty}^{\infty} term\mathcal{D}1 : -\frac{U^{a-b}}{1 - \kappa r \cos \phi} \frac{\partial U^b}{\partial s} - V^{a-b} \frac{\partial U^b}{\partial r} - \frac{W^{a-b}}{r} \frac{\partial U^b}{\partial \theta} \\
& + \sum_{b=-\infty}^{\infty} term\mathcal{X}1 : \frac{\kappa \cos \phi}{1 - \kappa r \cos \phi} U^{a-b} V^b - \frac{\kappa \sin \phi}{(1 - \kappa r \cos \phi)} U^{a-b} W^b \\
& + ib\kappa P^{a-b} U^b
\end{aligned} \tag{46}$$

Multiply $(1 - \kappa r \cos \phi)$, we have:

$$\begin{aligned}
& -iak(1 - \kappa r \cos \phi)U^a + \frac{\partial P^a}{\partial s} \\
& = term\mathcal{D}1 : \sum_{b=-\infty}^{\infty} -U^{a-b} \frac{\partial U^b}{\partial s} - (1 - \kappa r \cos \phi) V^{a-b} \frac{\partial U^b}{\partial r} - (1 - \kappa r \cos \phi) \frac{W^{a-b}}{r} \frac{\partial U^b}{\partial \theta} \\
& + term\mathcal{X}1 : \sum_{b=-\infty}^{\infty} \kappa \cos \phi U^{a-b} V^b - \kappa \sin \phi U^{a-b} W^b + \\
& term\mathcal{P}1 : \sum_{b=-\infty}^{\infty} ib\kappa(1 - \kappa r \cos \phi) P^{a-b} U^b
\end{aligned} \tag{47}$$

$\int \int XXr\psi_\alpha dr d\theta$, we have:

$$RHS = \int_0^{2\pi} \int_0^h [term\mathcal{D}1 + term\mathcal{X}1 + term\mathcal{P}1] r\psi_\alpha dr d\theta \tag{48}$$

1. the first $\mathcal{D}1$ tems:

We ref the wiki [https](https://en.wikipedia.org/wiki/Leibniz_integral_rule) :

en.wikipedia.org/wiki/Leibniz_integral_rule

General form: Differentiation under the integral sign:

$$\frac{d}{dx} \left(\int_{a(x)}^{b(x)} f(x, t) dt \right) = f(x, b(x)) \cdot \frac{d}{dx} b(x) + f(x, a(x)) \cdot \frac{d}{dx} a(x) = \int_{a(x)}^{b(x)} \frac{d}{dx} f(x, t) dt \tag{49}$$

$$df = \frac{\partial f}{\partial x} dx + \frac{\partial f}{\partial y} dy \tag{50}$$

For partial difference, for a given β , the derivation of the fuction $g(\alpha) = \int_{a(\alpha)}^{b(\beta)} f(x, \alpha) dx$ is

$$\frac{d}{d\alpha} \left(\int_{a(\alpha)}^{b(\beta)} f(x, \alpha) dx \right) = 0 + \frac{da(\alpha)}{d\alpha} f(a(\alpha), \alpha) = \int_{a(\alpha)}^{b(\beta)} \frac{\partial}{\partial \alpha} f(x, \alpha) dx \tag{51}$$

1.1

$$\begin{aligned}
& \sum_{b=-\infty}^{\infty} \int_0^{2\pi} \int_0^h [-rU^{a-b} \frac{\partial U^b}{\partial s}] \psi_\alpha dr d\theta \\
&= \sum_{b=-\infty}^{\infty} - \int_0^{2\pi} \int_0^h \frac{\partial}{\partial s} [rU^{a-b} U^b \psi_\alpha] dr d\theta \\
&\quad + \int_0^{2\pi} \int_0^h U^b \frac{\partial}{\partial s} [rU^{a-b} \psi_\alpha] dr d\theta \\
&= \sum_{b=-\infty}^{\infty} - \frac{\partial}{\partial s} \int_0^{2\pi} \int_0^h [rU^{a-b} U^b \psi_\alpha] dr d\theta + \int_0^{2\pi} \frac{dh(s)}{ds} [rU^{a-b} U^b \psi_\alpha]_{r=h} d\theta \\
&\quad + \int_0^{2\pi} \int_0^h \frac{r \partial U^{a-b}}{\partial s} U^b \psi_\alpha dr d\theta \\
&\quad + \int_0^{2\pi} \int_0^h \frac{\partial \psi_\alpha}{\partial s} r U^{a-b} U^b dr d\theta
\end{aligned} \tag{52}$$

here, we gives a relationship between U^a and V^a at the boundary which to dliminate V^a tems:

$$h'U^{a-b} = (1 - \kappa h \cos \phi) V^{a-b} \tag{53}$$

1.2

$$\begin{aligned}
& \sum_{b=-\infty}^{\infty} \int_0^{2\pi} \int_0^h [-(1 - \kappa r \cos \phi) V^{a-b} \frac{\partial U^b}{\partial r}] r \psi_\alpha dr d\theta \\
&= - \sum_{b=-\infty}^{\infty} \int_0^{2\pi} \int_0^h \frac{\partial (r(1 - \kappa r \cos \phi) V^{a-b} U^b \psi_\alpha)}{\partial r} dr d\theta \\
&\quad + \int_0^{2\pi} \int_0^h U^b \frac{\partial (r(1 - \kappa r \cos \phi) V^{a-b} \psi_\alpha)}{\partial r} dr d\theta \\
&= - \sum_{b=-\infty}^{\infty} \int_0^{2\pi} [(r(1 - \kappa r \cos \phi) V^{a-b} U^b) \psi_\alpha]_0^h d\theta \\
&\quad + \int_0^{2\pi} \int_0^h U^b \frac{\partial (r(1 - \kappa r \cos \phi) V^{a-b})}{\partial r} \psi_\alpha dr d\theta \\
&\quad + \int_0^{2\pi} \int_0^h U^b \frac{\partial (\psi_\alpha)}{\partial r} r (1 - \kappa r \cos \phi) V^{a-b} dr d\theta \\
&\quad = - \sum_{b=-\infty}^{\infty} \int_0^{2\pi} [(h h' U^{a-b} U^b) \psi_\alpha]_0^h d\theta \\
&\quad + \int_0^{2\pi} \int_0^h U^b \frac{\partial (r(1 - \kappa r \cos \phi) V^{a-b})}{\partial r} \psi_\alpha dr d\theta \\
&\quad + \int_0^{2\pi} \int_0^h U^b \frac{\partial (\psi_\alpha)}{\partial r} r (1 - \kappa r \cos \phi) V^{a-b} dr d\theta
\end{aligned} \tag{54}$$

$$\begin{aligned}
& \sum_{b=-\infty}^{\infty} \int_0^{2\pi} \int_0^h [-(1 - \kappa r \cos \phi) \frac{W^{a-b}}{r} \frac{\partial U^b}{\partial \theta}] r \psi_\alpha dr d\theta \\
&= - \sum_{b=-\infty}^{\infty} \int_0^{2\pi} \int_0^h \frac{\partial((1 - \kappa r \cos \phi) W^{a-b} U^b \psi_\alpha)}{\partial \theta} dr d\theta \\
&\quad + \int_0^{2\pi} \int_0^h U^b \frac{\partial((1 - \kappa r \cos \phi) W^{a-b})}{\partial \theta} \psi_\alpha dr d\theta \\
&\quad + \int_0^{2\pi} \int_0^h U^b \frac{\partial(\psi_\alpha)}{\partial \theta} ((1 - \kappa r \cos \phi) W^{a-b}) dr d\theta \\
&= - \sum_{b=-\infty}^{\infty} \int_0^h [(1 - \kappa r \cos \phi) W^{a-b} U^b \psi_\alpha]_0^{2\pi} dr \\
&\quad + \int_0^{2\pi} \int_0^h U^b \frac{\partial((1 - \kappa r \cos \phi) W^{a-b})}{\partial \theta} \psi_\alpha dr d\theta \\
&\quad + \int_0^{2\pi} \int_0^h U^b \frac{\partial(\psi_\alpha)}{\partial \theta} ((1 - \kappa r \cos \phi) W^{a-b}) dr d\theta \\
&= 0(\text{periodic}) + \int_0^{2\pi} \int_0^h U^b \frac{\partial((1 - \kappa r \cos \phi) W^{a-b})}{\partial \theta} \psi_\alpha dr d\theta \\
&\quad + \int_0^{2\pi} \int_0^h U^b \frac{\partial(\psi_\alpha)}{\partial \theta} ((1 - \kappa r \cos \phi) W^{a-b}) dr d\theta
\end{aligned} \tag{55}$$

Combine together:

$$\begin{aligned}
& \int_0^{2\pi} \int_0^h [term \mathcal{D}1] r \psi_\alpha dr d\theta = \sum_{b=-\infty}^{\infty} \\
& \quad \{ (\int_0^{2\pi} \int_0^h \frac{\partial \psi_\alpha}{\partial s} r U^{a-b} U^b dr d\theta \\
& \quad + \int_0^{2\pi} \int_0^h \frac{\partial(\psi_\alpha)}{\partial r} r (1 - \kappa r \cos \phi) V^{a-b} U^b dr d\theta \\
& \quad + \int_0^{2\pi} \int_0^h \frac{\partial(\psi_\alpha)}{\partial \theta} ((1 - \kappa r \cos \phi) W^{a-b} U^b) dr d\theta) \\
& \quad + (\int_0^{2\pi} \int_0^h U^b \frac{\partial U^{a-b}}{\partial s} r \psi_\alpha dr d\theta \\
& \quad + \int_0^{2\pi} \int_0^h U^b \frac{\partial(r(1 - \kappa r \cos \phi) V^{a-b})}{\partial r} \psi_\alpha dr d\theta \\
& \quad + \int_0^{2\pi} \int_0^h U^b \frac{\partial((1 - \kappa r \cos \phi) W^{a-b})}{\partial \theta} \psi_\alpha dr d\theta) \\
& \quad - \frac{\partial}{\partial s} \int_0^{2\pi} \int_0^h [r U^{a-b} U^b \psi_\alpha] dr d\theta \}
\end{aligned} \tag{56}$$

We apply eq 5, find that:

$$\begin{aligned}
& -i(a-b)\kappa r(1 - \kappa r \cos(\phi)) P^{a-b} + [\frac{\partial(U^{a-b} r)}{\partial s} + \frac{\partial(V^{a-b} r(1 - \kappa r \cos(\phi)))}{\partial r} + \frac{\partial(W^{a-b}(1 - \kappa r \cos(\phi)))}{\partial \theta}] \\
& = o(M^2)
\end{aligned} \tag{57}$$

We have the second terms in eq(31) are equal to:

$$\begin{aligned} & \int_0^{2\pi} \int_0^h U^b [-i(a-b)\kappa r(1-\kappa r \cos(\phi)) P^{a-b}] \psi_\alpha dr d\theta \\ &= i(a-b)\kappa \Psi_{\alpha\beta\gamma} [r(1-\kappa r \cos\phi)] P_\beta^{a-b} U_\gamma^b \end{aligned} \quad (58)$$

And, the longitudinal derivation s can also be expand about the duct modes, with note $[r], (\theta), \{s\}$:

$$\begin{aligned} & \frac{\partial}{\partial s} \int_0^{2\pi} \int_0^h [r U^{a-b} U^b \psi_\alpha] dr d\theta \\ &= \frac{\partial}{\partial s} \int_0^{2\pi} \int_0^h [r \psi_\beta \psi_\gamma \psi_\alpha] U_\beta^{a-b} U_\gamma^b dr d\theta \\ &= \frac{\partial}{\partial s} \left(\int_0^{2\pi} \int_0^h [r \psi_\beta \psi_\gamma \psi_\alpha] dr d\theta \right) U_\beta^{a-b} U_\gamma^b \\ & \quad + \frac{\partial U_\beta^{a-b} U_\gamma^b}{\partial s} \int_0^{2\pi} \int_0^h [r \psi_\beta \psi_\gamma \psi_\alpha] dr d\theta \\ &= \frac{\partial}{\partial s} \left(\int_0^{2\pi} \int_0^h [r \psi_\beta \psi_\gamma \psi_\alpha] dr d\theta \right) U_\beta^{a-b} U_\gamma^b \\ & \quad + \left(\frac{dU_\beta^{a-b}}{ds} U_\gamma^b + \frac{dU_\gamma^b}{ds} U_\beta^{a-b} \right) \int_0^{2\pi} \int_0^h [r \psi_\beta \psi_\gamma \psi_\alpha] dr d\theta \end{aligned} \quad (59)$$

2. the second $\mathcal{X}1$ tems:

$$\begin{aligned} & term\mathcal{X}1 : \sum_{b=-\infty}^{\infty} \kappa \cos\phi U^{a-b} V^b - \kappa \sin\phi U^{a-b} W^b \\ & \sum_{b=-\infty}^{\infty} \int_0^{2\pi} \int_0^h [\kappa \cos\phi U^{a-b} V^b - \kappa \sin\phi U^{a-b} W^b] r \psi_\alpha dr d\theta \\ &= \kappa \Psi_{\alpha\beta\gamma} [r \cos\phi] U_\beta^{a-b} V_\gamma^b - \kappa \Psi_{\alpha\beta\gamma} [r \sin\phi] U_\beta^{a-b} W_\gamma^b \end{aligned} \quad (60)$$

3. the second $\mathcal{P}1$ tems:

$$\begin{aligned} & term\mathcal{P}1 : \sum_{b=-\infty}^{\infty} ib\kappa(1-\kappa r \cos\phi) P^{a-b} U^b \\ & \sum_{b=-\infty}^{\infty} \int_0^{2\pi} \int_0^h [ib\kappa(1-\kappa r \cos\phi) P^{a-b} U^b] r \psi_\alpha dr d\theta \\ &= ib\kappa \Psi_{\alpha\beta\gamma} [r(1-\kappa r \cos\phi)] P_\beta^{a-b} U_\gamma^b \end{aligned} \quad (61)$$

4. The LHS terms:

$$\frac{\partial P^a}{\partial s} - ia\kappa(1-\kappa r \cos\phi) U^a$$

From 1.1 as example, we know that

$$\begin{aligned}
& \int_0^{2\pi} \int_0^h \frac{\partial}{\partial s} [rU^{a-b}U^b\psi_\alpha] dr d\theta \\
&= \frac{\partial}{\partial s} \int_0^{2\pi} \int_0^h [rU^{a-b}U^b\psi_\alpha] dr d\theta - \int_0^{2\pi} \frac{dh(s)}{ds} [rU^{a-b}U^b\psi_\alpha]_{r=h} d\theta
\end{aligned} \tag{62}$$

4.1

$$\begin{aligned}
& \int_0^{2\pi} \int_0^h [\frac{\partial P^a}{\partial s}] r\psi_\alpha dr d\theta \\
&= \int_0^{2\pi} \int_0^h [\frac{\partial(P_\beta^a\psi_\beta)}{\partial s}] r\psi_\alpha dr d\theta \\
&= \int_0^{2\pi} \int_0^h [\frac{\partial(P_\beta^a\psi_\beta)}{\partial s}] r\psi_\alpha dr d\theta - \int_0^{2\pi} \int_0^h [\frac{\partial(\psi_\alpha)}{\partial s}] r\psi_\beta dr d\theta P_\beta^a \\
&= \frac{\partial}{\partial s} \int_0^{2\pi} \int_0^h (P_\beta^a\psi_\beta) r\psi_\alpha dr d\theta - \frac{dh(s)}{ds} [P_\beta^a\psi_\beta r\psi_\alpha]_{r=h} - \int_0^{2\pi} \int_0^h [\frac{\partial(\psi_\alpha)}{\partial s}] r\psi_\beta dr d\theta P_\beta^a \\
&= \frac{d}{ds} (P_\beta^a \widehat{\delta}_{\alpha\beta}) - \int_0^{2\pi} \frac{dh(s)}{ds} [P_\beta^a\psi_\beta r\psi_\alpha]_{r=h} d\theta - \int_0^{2\pi} \int_0^h [\frac{\partial(\psi_\alpha)}{\partial s}] r\psi_\beta dr d\theta P_\beta^a
\end{aligned} \tag{63}$$

4.2

$$\begin{aligned}
& \int_0^{2\pi} \int_0^h [-ia\kappa(1 - \kappa r \cos\phi)U^a] r\psi_\alpha dr d\theta \\
&= -ia\kappa\Psi_{\alpha\beta}[r(1 - \kappa r \cos\phi)]U_\beta^a
\end{aligned} \tag{64}$$

Finally, putting all together becomes:

$$\begin{aligned}
& \frac{d}{ds}(P_\beta^a)\widehat{\delta}_{\alpha\beta} - \int_0^{2\pi} \frac{dh(s)}{ds} [P_\beta^a \psi_\beta r \psi_\alpha]_{r=h} d\theta - \int_0^{2\pi} \int_0^h \left[\frac{\partial(\psi_\alpha)}{\partial s} \right] r \psi_\beta dr d\theta P_\beta^a - i a \kappa \Psi_{\alpha\beta} [r(1 - \kappa r \cos\phi)] U_\beta^a \\
&= \frac{d}{ds}(P_\beta^a)\widehat{\delta}_{\alpha\beta} - i a \kappa \Psi_{\alpha\beta} [r(1 - \kappa r \cos\phi)] U_\beta^a - \int_0^{2\pi} h h' [P_\beta^a \psi_\beta \psi_\alpha]_{r=h} d\theta - \Psi_{\{\alpha\}\beta} [r] P_\beta^a \\
&= \sum_{b=-\infty}^{\infty} \\
&\quad (eq31) : \left\{ \left(\int_0^{2\pi} \int_0^h \frac{\partial \psi_\alpha}{\partial s} r U^{a-b} U^b dr d\theta \right. \right. \\
&\quad \left. \left. + \int_0^{2\pi} \int_0^h \frac{\partial(\psi_\alpha)}{\partial r} r (1 - \kappa r \cos\phi) V^{a-b} U^b dr d\theta \right. \right. \\
&\quad \left. \left. + (eq33) : i(a-b) \kappa \Psi_{\alpha\beta\gamma} [r(1 - \kappa r \cos\phi)] P_\beta^{a-b} U_\gamma^b \right. \right. \\
&\quad \left. \left. eq(34) : -\frac{\partial}{\partial s} \left(\int_0^{2\pi} \int_0^h [r \psi_\beta \psi_\gamma \psi_\alpha] dr d\theta \right) U_\beta^{a-b} U_\gamma^b \right. \right. \\
&\quad \left. \left. - \left(\frac{dU_\beta^{a-b}}{ds} U_\gamma^b + \frac{dU_\gamma^b}{ds} U_\beta^{a-b} \right) \int_0^{2\pi} \int_0^h [r \psi_\beta \psi_\gamma \psi_\alpha] dr d\theta \right. \right. \\
&\quad \left. \left. + eq(35) : \kappa \Psi_{\alpha\beta\gamma} [r \cos\phi] U_\beta^{a-b} V_\gamma^b - \kappa \Psi_{\alpha\beta\gamma} [r \sin\phi] U_\beta^{a-b} W_\gamma^b \right. \right. \\
&\quad \left. \left. + eq(36) : i b \kappa \Psi_{\alpha\beta\gamma} [r(1 - \kappa r \cos\phi)] P_\beta^{a-b} U_\gamma^b \right. \right. \\
&\quad \left. \left. = (abbreviation) : \right. \right. \\
&\quad \Psi_{\{\alpha\}\beta\gamma} [r] U_\beta^{a-b} U_\gamma^a + \Psi_{[\alpha]\beta\gamma} [r(1 - \kappa r \cos\phi)] V_\beta^{a-b} U_\gamma^a + \Psi_{(\alpha)\beta\gamma} [(1 - \kappa r \cos\phi)] W_\beta^{a-b} U_\gamma^a \\
&\quad + i(a-b) \kappa \Psi_{\alpha\beta\gamma} [r(1 - \kappa r \cos\phi)] P_\beta^{a-b} U_\gamma^b \\
&\quad - \frac{\partial}{\partial s} (\Psi_{\alpha\beta\gamma} [r] U_\beta^{a-b} U_\gamma^b - \Psi_{\alpha\beta\gamma} [r] \left(\frac{dU_\beta^{a-b}}{ds} U_\gamma^b + \frac{dU_\gamma^b}{ds} U_\beta^{a-b} \right)) \\
&\quad + \kappa \Psi_{\alpha\beta\gamma} [r \cos\phi] U_\beta^{a-b} V_\gamma^b - \kappa \Psi_{\alpha\beta\gamma} [r \sin\phi] U_\beta^{a-b} W_\gamma^b \\
&\quad + i b \kappa \Psi_{\alpha\beta\gamma} [r(1 - \kappa r \cos\phi)] P_\beta^{a-b} U_\gamma^b \\
&\quad (65)
\end{aligned}$$

with the e^s term:

$$\begin{aligned}
& -i a \kappa U^a + \frac{1}{1 - \kappa r \cos\phi} \frac{\partial P^a}{\partial s} \\
&= \sum_{b=-\infty}^{\infty} term\mathcal{D}1 : -\frac{U^{a-b}}{1 - \kappa r \cos\phi} \frac{\partial U^b}{\partial s} - V^{a-b} \frac{\partial U^b}{\partial r} - \frac{W^{a-b}}{r} \frac{\partial U^b}{\partial \theta} \\
&+ \sum_{b=-\infty}^{\infty} term\mathcal{X}1 : \frac{\kappa \cos\phi}{1 - \kappa r \cos\phi} U^{a-b} V^b - \frac{\kappa \sin\phi}{(1 - \kappa r \cos\phi)} U^{a-b} W^b \\
&+ \sum_{b=-\infty}^{\infty} term\mathcal{P}1 : i b \kappa P^{a-b} U^b \\
&\quad (66)
\end{aligned}$$

We have:

$$\begin{aligned}
& -ia\kappa\Psi_{\alpha\beta}[r(1-\kappa r\cos\phi)]U_\beta^a + \frac{d}{ds}(P_\beta^a)\widehat{\delta}_{\alpha\beta} - \int_0^{2\pi} hh'[\psi_\beta\psi_\alpha]_{r=h}d\theta P_\beta^a - \Psi_{\{\alpha\}\beta}[r]P_\beta^a \\
& = \underline{term\mathcal{D}1}:\Psi_{\{\alpha\}\beta\gamma}[r]U_\beta^{a-b}U_\gamma^a + \Psi_{[\alpha]\beta\gamma}[r(1-\kappa r\cos\phi)]V_\beta^{a-b}U_\gamma^a + \Psi_{(\alpha)\beta\gamma}[(1-\kappa r\cos\phi)]W_\beta^{a-b}U_\gamma^a \\
& \quad + \underline{term(D1+\mathcal{P}1)}:i(a)\kappa\Psi_{\alpha\beta\gamma}[r(1-\kappa r\cos\phi)]P_\beta^{a-b}U_\gamma^b \\
& \quad - \underline{term\mathcal{D}1}:\frac{\partial}{\partial s}(\Psi_{\alpha\beta\gamma}[r]U_\beta^{a-b}U_\gamma^b - \Psi_{\alpha\beta\gamma}[r](\frac{dU_\beta^{a-b}}{ds}U_\gamma^b + \frac{dU_\gamma^b}{ds}U_\beta^{a-b})) \\
& \quad + \underline{term\mathcal{X}1}:\kappa\Psi_{\alpha\beta\gamma}[r\cos\phi]U_\beta^{a-b}V_\gamma^b - \kappa\Psi_{\alpha\beta\gamma}[r\sin\phi]U_\beta^{a-b}W_\gamma^b
\end{aligned} \tag{67}$$

B. Momentum e^r term

Second, deal with the e^r term:

$$\begin{aligned}
& -ia\kappa V^a + \frac{\partial P^a}{\partial r} \\
& = \sum_{b=-\infty}^{\infty} term\mathcal{D}2: -\frac{U^{a-b}}{1-\kappa r\cos\phi}\frac{\partial V^b}{\partial s} - V^{a-b}\frac{\partial V^b}{\partial r} - \frac{W^{a-b}}{r}\frac{\partial V^b}{\partial \theta} \\
& \quad + \sum_{b=-\infty}^{\infty} term\mathcal{X}2: \frac{W^{a-b}W^b}{r} - \frac{\kappa\cos\phi}{(1-\kappa r\cos\phi)}U^{a-b}U^b \\
& \quad + term\mathcal{P}2: \sum_{b=-\infty}^{\infty} ib\kappa P^{a-b}V^b
\end{aligned} \tag{68}$$

$$LHS-2: \frac{\partial P^a}{\partial r}(1-\kappa r\cos\phi)$$

$$\begin{aligned}
& \int_0^{2\pi} \int_0^h [\frac{\partial P^a}{\partial r}(1-\kappa r\cos\phi)]r\psi_\alpha dr d\theta \\
& = \int_0^{2\pi} \int_0^h [\frac{\partial\psi_\beta(1-\kappa r\cos\phi)r\psi_\alpha}{\partial r}]dr d\theta P_\beta^a - \int_0^{2\pi} \int_0^h [\frac{\partial\psi_\alpha(1-\kappa r\cos\phi)r}{\partial r}]\psi_\beta dr d\theta P_\beta^a \\
& \quad = \int_0^{2\pi} \int_0^h [\frac{\partial\psi_\beta(1-\kappa r\cos\phi)r\psi_\alpha}{\partial r}]dr d\theta P_\beta^a \\
& \quad - \int_0^{2\pi} \int_0^h [\frac{\partial\psi_\alpha}{\partial r}](1-\kappa r\cos\phi)r\psi_\beta dr d\theta P_\beta^a - \int_0^{2\pi} \int_0^h [\frac{\partial(1-\kappa r\cos\phi)r}{\partial r}]\psi_\alpha\psi_\beta dr d\theta P_\beta^a \\
& \quad = \int_0^{2\pi} [\psi_\alpha\psi_\beta r(1-\kappa r\cos\phi)]_0^h d\theta P_\beta^a \\
& \quad - \int_0^{2\pi} \int_0^h [\frac{\partial\psi_\alpha}{\partial r}](1-\kappa r\cos\phi)r\psi_\beta dr d\theta P_\beta^a - \int_0^{2\pi} \int_0^h [1-2\kappa r\cos\phi]\psi_\alpha\psi_\beta dr d\theta P_\beta^a \\
& = \int_0^{2\pi} [\psi_\alpha\psi_\beta r(1-\kappa r\cos\phi)]_0^h d\theta P_\beta^a - \Psi_{[\alpha]\beta}[r(1-\kappa r\cos\phi)]P_\beta^a - \Psi_{\alpha\beta}[1-2\kappa r\cos\phi]P_\beta^a
\end{aligned} \tag{69}$$

The derivation of $term\mathcal{D}2$ is identical to A, we are not prove it again. $Term\mathcal{P}2$ also could be combine with the part separated term of $term\mathcal{D}2$ with V^b . $Term\mathcal{X}2$ is also easy to derive.

Thus, we have the final equation:

$$\begin{aligned}
& -ia\kappa\Psi_{\alpha\beta}[r(1-\kappa r\cos\phi)]V_{\beta}^a \\
& \int_0^{2\pi} [\psi_{\alpha}\psi_{\beta}r(1-\kappa r\cos\phi)]_0^h d\theta P_{\beta}^a - \Psi_{[\alpha]\beta}[r(1-\kappa r\cos\phi)]P_{\beta}^a - \Psi_{\alpha\beta}[1-2\kappa r\cos\phi]P_{\beta}^a \\
& = \underline{termD2} : \Psi_{\{\alpha\}\beta\gamma}[r]U_{\beta}^{a-b}V_{\gamma}^a + \Psi_{[\alpha]\beta\gamma}[r(1-\kappa r\cos\phi)]V_{\beta}^{a-b}V_{\gamma}^a + \Psi_{(\alpha)\beta\gamma}[(1-\kappa r\cos\phi)]W_{\beta}^{a-b}V_{\gamma}^a \\
& \quad + \underline{term(D2+\mathcal{P}2)} : i(a)\kappa\Psi_{\alpha\beta\gamma}[r(1-\kappa r\cos\phi)]P_{\beta}^{a-b}V_{\gamma}^b \\
& \quad + \underline{termD2} : -\frac{\partial}{\partial s}(\Psi_{\alpha\beta\gamma}[r]U_{\beta}^{a-b}V_{\gamma}^b - \Psi_{\alpha\beta\gamma}[r](\frac{dU_{\beta}^{a-b}}{ds}V_{\gamma}^b + \frac{dV_{\gamma}^b}{ds}U_{\beta}^{a-b})) \\
& \quad + \underline{term\mathcal{X}2} : \Psi_{\alpha\beta\gamma}[1-\kappa r\cos\phi]W_{\beta}^{a-b}W_{\gamma}^b - \kappa\Psi_{\alpha\beta\gamma}[r\cos\phi]U_{\beta}^{a-b}U_{\gamma}^b
\end{aligned} \tag{70}$$

C. Momentum e^{θ} term

Third, deal with the e^{θ} term:

$$\begin{aligned}
& -ia\kappa W^a + \frac{1}{r} \frac{\partial P^a}{\partial \theta} \\
& = \sum_{b=-\infty}^{\infty} \underline{termD3} : -\frac{U^{a-b}}{1-\kappa r\cos\phi} \frac{\partial W^b}{\partial s} - V^{a-b} \frac{\partial W^b}{\partial r} - \frac{W^{a-b}}{r} \frac{\partial W^b}{\partial \theta} \\
& \quad + \sum_{b=-\infty}^{\infty} \underline{term\mathcal{X}3} : \frac{\kappa \sin\phi}{(1-\kappa r\cos\phi)} U^{a-b} U^b - \frac{W^{a-b} V^b}{r} \\
& \quad + \underline{term\mathcal{P}3} : \sum_{b=-\infty}^{\infty} ib\kappa P^{a-b} W^b
\end{aligned} \tag{71}$$

$$\text{LHS-2: } \frac{\partial P^a}{\partial \theta} \frac{(1-\kappa r\cos\phi)}{r}$$

$$\begin{aligned}
& \int_0^{2\pi} \int_0^h [\frac{\partial P^a}{\partial \theta} \frac{(1-\kappa r\cos\phi)}{r}] r \psi_{\alpha} dr d\theta \\
& = \int_0^{2\pi} \int_0^h [\frac{\partial \psi_{\beta}(1-\kappa r\cos\phi)}{\partial \theta} \psi_{\alpha}] dr d\theta P_{\beta}^a - \int_0^{2\pi} \int_0^h [\frac{\partial \psi_{\alpha}(1-\kappa r\cos\phi)}{\partial \theta}] \psi_{\beta} dr d\theta P_{\beta}^a \\
& = 0 - \int_0^{2\pi} \int_0^h [\frac{\partial \psi_{\alpha}}{\partial \theta}] (1-\kappa r\cos\phi) \psi_{\beta} dr d\theta P_{\beta}^a - \int_0^{2\pi} \int_0^h [\frac{\partial (1-\kappa r\cos\phi)}{\partial \theta}] \psi_{\alpha} \psi_{\beta} dr d\theta P_{\beta}^a \\
& = - \int_0^{2\pi} \int_0^h [\frac{\partial \psi_{\alpha}}{\partial \theta}] (1-\kappa r\cos\phi) \psi_{\beta} dr d\theta P_{\beta}^a + \kappa \int_0^{2\pi} \int_0^h [r \sin\phi] \psi_{\alpha} \psi_{\beta} dr d\theta P_{\beta}^a \\
& = -\Psi_{(\alpha)\beta}[(1-\kappa r\cos\phi)]P_{\beta}^a - \kappa\Psi_{\alpha\beta}[r \sin\phi]P_{\beta}^a
\end{aligned} \tag{72}$$

The derivation of $\underline{termD3}$ is identical to A, we are not prove it again. $\underline{Term\mathcal{P}3}$ also could be combine with the part separated term of $\underline{termD3}$ with W^b . $\underline{Term\mathcal{X}3}$ is also easy to derive.

Thus, we have the final equation:

$$\begin{aligned}
& -ia\kappa\Psi_{\alpha\beta}[r(1-\kappa r\cos\phi)]W_\beta^a \\
& -\Psi_{(\alpha)\beta}[(1-\kappa r\cos\phi)]P_\beta^a - \kappa\Psi_{\alpha\beta}[r\sin\phi]P_\beta^a \\
= & \underline{term\mathcal{D}2}:\Psi_{\{\alpha\}\beta\gamma}[r]U_\beta^{a-b}W_\gamma^a + \Psi_{[\alpha]\beta\gamma}[r(1-\kappa r\cos\phi)]V_\beta^{a-b}W_\gamma^a + \Psi_{(\alpha)\beta\gamma}[(1-\kappa r\cos\phi)]W_\beta^{a-b}W_\gamma^a \\
& +\underline{term(D2+\mathcal{P}2)}:i(a)\kappa\Psi_{\alpha\beta\gamma}[r(1-\kappa r\cos\phi)]P_\beta^{a-b}W_\gamma^b \\
& +\underline{term\mathcal{D}2}:-\frac{\partial}{\partial s}(\Psi_{\alpha\beta\gamma}[r]U_\beta^{a-b}V_\gamma^b - \Psi_{\alpha\beta\gamma}[r](\frac{dU_\beta^{a-b}}{ds}W_\gamma^b + \frac{dW_\gamma^b}{ds}U_\beta^{a-b})) \\
& +\underline{term\mathcal{X}2}:\kappa\Psi_{\alpha\beta\gamma}[r\sin\phi]U_\beta^{a-b}U_\gamma^b - \Psi_{\alpha\beta\gamma}[1-\kappa r\cos\phi]W_\beta^{a-b}V_\gamma^b
\end{aligned} \tag{73}$$

IV. Merge the four equations and eliminate the V_γ^b and W_γ^b

A. V_α^a & W_α^a for RHS

Using the linear relationships:

$$\begin{aligned}
& ia\kappa V^a = \frac{\partial P^a}{\partial r} \\
& := \int \int ia\kappa V_\beta^a \psi_\beta r \psi_\alpha dr d\theta = \int \int \frac{\partial P_\beta^a \psi_\beta}{\partial r} r \psi_\alpha dr d\theta \\
= & ia\kappa V_\beta^a \widehat{\delta}_{\alpha\beta} = \Psi_{\alpha[\beta]}[r]P_\beta^a = \int_0^{2\pi} [r\psi_\alpha \psi_\beta]_0^h d\theta P_\beta^a - \int \int \psi_\alpha \psi_\beta dr d\theta P_\beta^a - \int \int \frac{\partial \psi_\alpha}{\partial r} \psi_\beta r dr d\theta P_\beta^a
\end{aligned} \tag{74}$$

$$\begin{aligned}
& ia\kappa W^a = \frac{1}{r} \frac{\partial P^a}{\partial \theta} \\
& := \int \int ia\kappa W_\beta^a \psi_\beta r \psi_\alpha dr d\theta = \int \int \frac{\partial P_\beta^a \psi_\beta}{\partial \theta} \frac{1}{r} r \psi_\alpha dr d\theta \\
& = ia\kappa W_\beta^a \widehat{\delta}_{\alpha\beta} = \Psi_{\alpha(\beta)}[r]P_\beta^a = 0 - \Psi_{(\alpha)\beta}[r]P_\beta^a
\end{aligned} \tag{75}$$

Thus, we can establish relationships between the tranverse modes and pressure modes (no summation over α)

$$\underline{\underline{V_\beta^a \widehat{\delta}_{\alpha\beta} = \frac{1}{ia\kappa} [\int_0^{2\pi} [r\psi_\alpha \psi_\beta]_0^h d\theta - \Psi_{\alpha\beta} - \Psi_{[\alpha]\beta}[r]] P_\beta^a = \mathbf{V}_{\alpha\beta}^a P_\beta^a}} \tag{76}$$

$$\underline{\underline{W_\beta^a \widehat{\delta}_{\alpha\beta} = -\frac{1}{ia\kappa} \Psi_{(\alpha)\beta} P_\beta^a = \mathbf{W}_{\alpha\beta}^a P_\beta^a}} \tag{77}$$

B. $\frac{d}{ds}V_\alpha^a$ & $\frac{d}{ds}W_\alpha^a$ for RHS

We also require modal expressions for $\frac{d}{ds}V_\alpha^a$ and $\frac{d}{ds}W_\alpha^a$.

We differentiate eq71 with respect to s:

$$\begin{aligned}\frac{\partial V^a}{\partial s} &= \frac{1}{ia\kappa} \frac{\partial^2 P^a}{\partial s \partial r} \\ &= \frac{\partial}{\partial r}((1 - \kappa r \cos\phi)U^a)\end{aligned}\tag{78}$$

where we have used symmetry of mixed partials and the linear expression for $\frac{\partial P^a}{\partial s}$ from eq 21.

From 1.1 as example, we know that

$$\begin{aligned}& \int_0^{2\pi} \int_0^h \frac{\partial}{\partial s} [rU^{a-b}U^b\psi_\alpha] dr d\theta \\ &= \frac{\partial}{\partial s} \int_0^{2\pi} \int_0^h [rU^{a-b}U^b\psi_\alpha] dr d\theta - \int_0^{2\pi} \frac{dh(s)}{ds} [rU^{a-b}U^b\psi_\alpha]_{r=h} d\theta\end{aligned}\tag{79}$$

here, we gives a relationship between U^a and V^a at the boundary which to eliminate V^a tems:

$$h'U_\beta^a = (1 - \kappa h \cos\phi)V_\beta^a\tag{80}$$

Multiplying this expression by $r\phi_\alpha$ and integrating across section of the duct, we obtain:

$$\begin{aligned}& \int_0^{2\pi} \int_0^h \frac{\partial V^a}{\partial s} r\psi_\alpha dr d\theta = \int_0^{2\pi} \int_0^h \frac{\partial}{\partial r}((1 - \kappa r \cos\phi)U^a) r\psi_\alpha dr d\theta \\ & LHS := \int_0^{2\pi} \int_0^h \frac{\partial [V_\beta^a \psi_\beta r\psi_\alpha]}{\partial s} dr d\theta - \int_0^{2\pi} \int_0^h \frac{\partial r\psi_\alpha}{\partial s} \psi_\beta dr d\theta V_\beta^a \\ &= \frac{\partial}{\partial s} \int_0^{2\pi} \int_0^h [V_\beta^a \psi_\beta r\psi_\alpha] dr d\theta - \int_0^{2\pi} \frac{dh(s)}{ds} [V_\beta^a \psi_\beta r\psi_\alpha]_0^h d\theta - \int_0^{2\pi} \int_0^h \frac{\partial \psi_\alpha}{\partial s} \psi_\beta r dr d\theta V_\beta^a \\ &= \frac{d}{ds} V_\beta^a \widehat{\delta}_{\alpha\beta} - \int_0^{2\pi} \frac{h'^2}{1 - \kappa h \cos\phi} [r\psi_\beta \psi_\alpha]_0^h d\theta U_\beta^a - \Psi_{\{\alpha\}\beta}[r] V_\beta^a \\ & RHS := \int_0^{2\pi} \int_0^h \frac{\partial}{\partial r}((1 - \kappa r \cos\phi)U_\beta^a \psi_\beta r\psi_\alpha) dr d\theta - \int_0^{2\pi} \int_0^h \frac{\partial(r\psi_\alpha)}{\partial r} (1 - \kappa r \cos\phi) U_\beta^a \psi_\beta dr d\theta \\ &= \int_0^{2\pi} [r(1 - \kappa r \cos\phi) \psi_\beta \psi_\alpha]_0^h d\theta U_\beta^a - \int_0^{2\pi} \int_0^h \frac{\partial \psi_\alpha}{\partial r} r(1 - \kappa r \cos\phi) \psi_\beta dr d\theta U_\beta^a - \int_0^{2\pi} \int_0^h (1 - \kappa r \cos\phi) \psi_\alpha \psi_\beta dr d\theta U_\beta^a \\ &= \int_0^{2\pi} [r(1 - \kappa r \cos\phi) \psi_\beta \psi_\alpha]_0^h d\theta U_\beta^a - \Psi_{[\alpha]\beta}[r(1 - \kappa r \cos\phi)] U_\beta^a - \Psi_{\alpha\beta}[(1 - \kappa r \cos\phi)] U_\beta^a\end{aligned}\tag{81}$$

Thus, LHS=RHS, we have:

$$\begin{aligned}& \underline{\underline{\frac{d}{ds} V_\beta^a \widehat{\delta}_{\alpha\beta} = \int_0^{2\pi} \frac{h'^2}{1 - \kappa h \cos\phi} [r\psi_\beta \psi_\alpha]_0^h d\theta U_\beta^a + \Psi_{\{\alpha\}\beta}[r] V_\beta^a}} \\ & + \underline{\underline{\int_0^{2\pi} [r(1 - \kappa r \cos\phi) \psi_\beta \psi_\alpha]_0^h d\theta U_\beta^a - \Psi_{[\alpha]\beta}[r(1 - \kappa r \cos\phi)] U_\beta^a - \Psi_{\alpha\beta}[(1 - \kappa r \cos\phi)] U_\beta^a}}\end{aligned}\tag{82}$$

Similarly for W^a , differentiating eq50 with respect to s and substituting the linear expression for $\frac{\partial P^a}{\partial s}$ by eq21:

$$\begin{aligned}\frac{\partial W^a}{\partial s} &= \frac{1}{ia\kappa} \frac{\partial^2 P^a}{\partial s \partial \theta} \\ &= \frac{1}{r} \frac{\partial}{\partial \theta} ((1 - \kappa r \cos \phi) U^a)\end{aligned}\tag{83}$$

Multiplying this expression by $r\phi_\alpha$ and integrating across section of the duct, we obtain:

$$\begin{aligned}\int_0^{2\pi} \int_0^h \frac{\partial W^a}{\partial s} r \psi_\alpha dr d\theta &= \int_0^{2\pi} \int_0^h \frac{1}{r} \frac{\partial}{\partial \theta} ((1 - \kappa r \cos \phi) U^a) r \psi_\alpha dr d\theta \\ LHS &:= \int_0^{2\pi} \int_0^h \frac{\partial [W_\beta^a \psi_\beta r \psi_\alpha]}{\partial s} dr d\theta - \int_0^{2\pi} \int_0^h \frac{\partial r \psi_\alpha}{\partial s} \psi_\beta dr d\theta W_\beta^a \\ &= \frac{\partial}{\partial s} \int_0^{2\pi} \int_0^h [W_\beta^a \psi_\beta r \psi_\alpha] dr d\theta - \int_0^{2\pi} \frac{dh(s)}{ds} [W_\beta^a \psi_\beta r \psi_\alpha]_0^h d\theta - \int_0^{2\pi} \int_0^h \frac{\partial \psi_\alpha}{\partial s} \psi_\beta r dr d\theta W_\beta^a \\ &= \frac{d}{ds} W_\beta^a \hat{\delta}_{\alpha\beta} - \int_0^{2\pi} \frac{dh(s)}{ds} [\psi_\beta r \psi_\alpha]_0^h d\theta W_\beta^a - \Psi_{\{\alpha\}\beta}[r] W_\beta^a \\ RHS &:= \int_0^{2\pi} \int_0^h \frac{\partial}{\partial \theta} ((1 - \kappa r \cos \phi) U_\beta^a \psi_\beta \psi_\alpha) dr d\theta - \int_0^{2\pi} \int_0^h \frac{\partial (\psi_\alpha)}{\partial \theta} (1 - \kappa r \cos \phi) U_\beta^a \psi_\beta dr d\theta \\ &= 0(\text{periodic}) - \Psi_{(\alpha)\beta}[1 - \kappa r \cos \phi] U_\beta^a\end{aligned}\tag{84}$$

Thus, LHS=RHS, we have:

$$\frac{d}{ds} W_\beta^a \hat{\delta}_{\alpha\beta} = \int_0^{2\pi} \frac{dh(s)}{ds} [\psi_\beta r \psi_\alpha]_0^h d\theta W_\beta^a + \Psi_{\{\alpha\}\beta}[r] W_\beta^a - \Psi_{(\alpha)\beta}[1 - \kappa r \cos \phi] U_\beta^a = -\Psi_{\alpha\{\beta\}}[r] W_\beta^a - \Psi_{(\alpha)\beta}[1 - \kappa r \cos \phi] U_\beta^a\tag{85}$$

V. Substitutue pressure modes for transverse velocity modes

A. mass equation

$$\begin{aligned}\frac{dU_\beta^a}{ds} \hat{\delta}_{\alpha\beta} - \Psi_{\{\alpha\}\beta}[r] U_\beta^a - ia\kappa \Psi_{\alpha\beta}[r(1 - \kappa \cos(\phi))] P_\beta^a - \Psi_{[\alpha]\beta}[r(1 - \kappa \cos(\phi))] \underline{\underline{V_\beta^a}} - \Psi_{(\alpha)\beta}[(1 - \kappa r \cos(\phi))] \underline{\underline{W_\beta^a}} \\ = \Psi_{\alpha\beta\gamma}[r(1 - \kappa r \cos(\phi))] \sum_{b=-\infty}^{+\infty} (-ib\kappa P_\beta^{a-b} P_\gamma^b - ib\kappa U_\beta^{a-b} U_\gamma^b - ib\kappa \underline{\underline{V_\beta^{a-b}}} \underline{\underline{V_\gamma^b}} - ib\kappa \underline{\underline{W_\beta^{a-b}}} \underline{\underline{W_\gamma^b}} - ia\kappa \frac{B}{2A} P_\beta^{a-b} P_\gamma^b)\end{aligned}\tag{86}$$

-\Psi_{\alpha\beta\gamma}[1-\kappa r\cos\phi]W_{\beta}^{a-b}V_{\gamma}^b &:= \sum_{b=-\infty}^{+\infty} \sum_{\beta=0}^{+\infty} \sum_{\gamma=0}^{+\infty} \underline{-\Psi_{\alpha\delta\epsilon}[1-\kappa r\cos\phi]\mathbf{W}_{\delta\beta}^{a-b}\mathbf{V}_{\epsilon\gamma}^b} p_{\beta}^{a-b} p_{\gamma}^b \rightarrow \mathcal{B}_{6.5}
\end{aligned} \tag{97}$$

Finally, we obtain two equations involving just pressure and longitudinal velocity modes. Here, $\mathbf{M}, \mathbf{N}, \mathcal{A}, \mathcal{B}$, and \mathcal{C} encoding the curvature of the duct. The terms $\mathbf{G}, \mathbf{H}, \mathbf{D}$ encode the variation in duct diameter as well as the torsion. The term ε encodes variation of diameter and the torsion together with curvature if either of the first two are present.

$$\begin{aligned}\widehat{\mathbf{I}}_{\alpha\beta}^a u_\beta^a + \mathbf{M}_{\alpha\beta}^a p_\beta^a + \mathbf{G}_{\alpha\beta}^a u_\beta^a &= \mathcal{A}_{\alpha\beta\gamma}^{ab} [u_\beta^{a-b}, u_\gamma^b] + \mathcal{B}_{\alpha\beta\gamma}^{ab} [p_\beta^{a-b}, p_\gamma^b] + \varepsilon_{\alpha\beta\gamma}^{ab} [u_\beta^{a-b}, p_\gamma^b] \\ \widehat{\mathbf{I}}_{\alpha\beta}^a p_\beta^a - \mathbf{N}_{\alpha\beta}^a u_\beta^a - \mathbf{H}_{\alpha\beta}^a p_\beta^a &= \mathcal{C}_{\alpha\beta\gamma}^{ab} [u_\beta^{a-b}, p_\gamma^b] + \mathcal{D}_{\alpha\beta\gamma}^{ab} [u_\beta^{a-b}, u_\gamma^b]\end{aligned}\quad (98)$$

VI. Introduce the admittance matrix

Due to the present of evanescent modes these equations are numerically unstable and cannot be integrated directly. Define a relation between the pressure and velocity in terms of the admittance. When solving for pressure, it is easier to work with the admittance rather than the impedance Z ($Y = Z^{-1}$), to avoid inverting large matrices in the work that will follow.

The following relationship is defined:

$$\widehat{\mathbf{I}}_{\alpha\beta}^a u_\beta^a = Y_{\alpha\beta}^a p_\beta^a + \mathcal{Y}_{\alpha\beta\gamma}^{ab} [p_\beta^{a-b}, p_\gamma^b] \quad (99)$$

where $Y = Y(s)$ is the linear part of the admittance and $\mathcal{Y} = \mathcal{Y}(s)$ is the second order non-linear correction to the admittance, henceforth referred to as the nonlinear admittance term. We differentiate it:

$$\widehat{\mathbf{I}}_{\alpha\beta}^a u' = Y_{\alpha\beta}^a p_\beta^a + Y_{\alpha\beta}^a p_\beta^a + \mathcal{Y}_{\alpha\beta\gamma}^{ab} [p_\beta^{a-b}, p_\gamma^b] + \mathcal{Y}_{\alpha\beta\gamma}^{ab} [p_\beta^{a-b}, p_\gamma^b] + \mathcal{Y}_{\alpha\beta\gamma}^{ab} [p_\beta^{a-b}, p_\gamma^b] \quad (100)$$

Substitute in eq98 of u' ,

$$\begin{aligned}-\mathbf{M}_{\alpha\beta}^a p_\beta^a - \mathbf{G}_{\alpha\beta}^a u_\beta^a + \mathcal{A}_{\alpha\beta\gamma}^{ab} [u_\beta^{a-b}, u_\gamma^b] + \mathcal{B}_{\alpha\beta\gamma}^{ab} [p_\beta^{a-b}, p_\gamma^b] + \varepsilon_{\alpha\beta\gamma}^{ab} [u_\beta^{a-b}, p_\gamma^b] \\ = Y_{\alpha\beta}^a p_\beta^a + Y_{\alpha\beta}^a p_\beta^a + \mathcal{Y}_{\alpha\beta\gamma}^{ab} [p_\beta^{a-b}, p_\gamma^b] + \mathcal{Y}_{\alpha\beta\gamma}^{ab} [p_\beta^{a-b}, p_\gamma^b] + \mathcal{Y}_{\alpha\beta\gamma}^{ab} [p_\beta^{a-b}, p_\gamma^b]\end{aligned}\quad (101)$$

Then, p'

$$\begin{aligned}-\mathbf{M}_{\alpha\beta}^a p_\beta^a - \mathbf{G}_{\alpha\beta}^a u_\beta^a + \mathcal{A}_{\alpha\beta\gamma}^{ab} [u_\beta^{a-b}, u_\gamma^b] + \mathcal{B}_{\alpha\beta\gamma}^{ab} [p_\beta^{a-b}, p_\gamma^b] + \varepsilon_{\alpha\beta\gamma}^{ab} [u_\beta^{a-b}, p_\gamma^b] \\ = Y_{\alpha\beta}^a p_\beta^a \\ + Y_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} (\mathbf{N}_{\alpha\beta}^a u_\beta^a + \mathbf{H}_{\alpha\beta}^a p_\beta^a + \mathcal{C}_{\alpha\beta\gamma}^{ab} [u_\beta^{a-b}, p_\gamma^b] + \mathcal{D}_{\alpha\beta\gamma}^{ab} [u_\beta^{a-b}, u_\gamma^b]) \\ + \mathcal{Y}_{\alpha\beta\gamma}^{ab} [p_\beta^{a-b}, p_\gamma^b] \\ + \mathcal{Y}_{\alpha\beta\gamma}^{ab} [\mathbf{N}_{\beta\delta}^{a-b} u_\delta^{a-b} + \mathbf{H}_{\beta\delta}^{a-b} p_\delta^{a-b}, p_\gamma^b] \\ + \mathcal{Y}_{\alpha\beta\gamma}^{ab} [p_\beta^{a-b}, \mathbf{N}_{\gamma\delta}^b u_\delta^b + \mathbf{H}_{\gamma\delta}^b p_\delta^b]\end{aligned}\quad (102)$$

Use eq99 to express u in terms of p, $\widehat{\mathbf{I}}_{\alpha\beta}^a u_\beta^a = Y_{\alpha\beta}^a p_\beta^a + \mathcal{Y}_{\alpha\beta\gamma}^{ab} [p_\beta^{a-b}, p_\gamma^b]$

$$\begin{aligned}
& -\mathbf{M}_{\alpha\beta}^a p_\beta^a - \mathbf{G}_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} Y_{\alpha\beta}^a p_\beta^a - \mathbf{G}_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} \mathcal{Y}_{\alpha\beta\gamma}^{ab} [p_\beta^{a-b}, p_\gamma^b] \\
& + \mathcal{A}_{\alpha\beta\gamma}^{ab} [\widehat{\mathbf{I}}_{\beta\alpha}^{a-b-1} Y_{\alpha\beta}^{\pm a-b} p_\beta^{a-b}, \widehat{\mathbf{I}}_{\gamma\alpha}^{b-1} Y_{\alpha\gamma}^{\pm b} p_\gamma^b] + \mathcal{B}_{\alpha\beta\gamma}^{ab} [p_\beta^{a-b}, p_\gamma^b] + \varepsilon_{\alpha\beta\gamma}^{ab} [\widehat{\mathbf{I}}_{\beta\alpha}^{a-b-1} Y_{\alpha\beta}^{\pm a-b} p_\beta^{a-b}, p_\gamma^b] \\
& = Y_{\alpha\beta}^a p_\beta^a + Y_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} (\mathbf{N}_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} Y_{\alpha\beta}^a p_\beta^a + \mathbf{N}_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} \mathcal{Y}_{\alpha\beta\gamma}^{ab} [p_\beta^{a-b}, p_\gamma^b] + \mathbf{H}_{\alpha\beta}^a p_\beta^a \\
& + \mathcal{C}_{\alpha\beta\gamma}^{ab} [\widehat{\mathbf{I}}_{\beta\alpha}^{a-b-1} Y_{\alpha\beta}^{\pm a-b} p_\beta^{a-b}, p_\gamma^b] + \mathcal{D}_{\alpha\beta\gamma}^{ab} [\widehat{\mathbf{I}}_{\beta\alpha}^{a-b-1} Y_{\alpha\beta}^{\pm a-b} p_\beta^{a-b}, \widehat{\mathbf{I}}_{\gamma\alpha}^{b-1} Y_{\alpha\gamma}^{\pm b} p_\gamma^b]) \\
& + \mathcal{Y}_{\alpha\beta\gamma}^{ab} [p_\beta^{a-b}, p_\gamma^b] + \mathcal{Y}_{\alpha\beta\gamma}^{ab} [\mathbf{N}_{\beta\delta}^{a-b} \widehat{\mathbf{I}}_{\delta\alpha}^{a-b-1} Y_{\alpha\delta}^{a-b} p_\delta^{a-b} + \mathbf{H}_{\beta\delta}^{a-b} p_\delta^{a-b}, p_\gamma^b] \\
& + \mathcal{Y}_{\alpha\beta\gamma}^{ab} [p_\beta^{a-b}, \mathbf{N}_{\gamma\delta}^b \widehat{\mathbf{I}}_{\delta\alpha}^{b-1} Y_{\alpha\delta}^b p_\delta^b + \mathbf{H}_{\gamma\delta}^b p_\delta^b]
\end{aligned} \tag{103}$$

This equation has two distinct orders of magnitude: terms linear in p, and terms quadratic in p. We can equate linear terms and the quadratic terms separately to get two distinct equations:

$$\text{linear} : Y_{\alpha\beta}^a p_\beta^a + Y_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} \mathbf{N}_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} Y_{\alpha\beta}^a p_\beta^a + \mathbf{M}_{\alpha\beta}^a p_\beta^a + Y_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} \mathbf{H}_{\alpha\beta}^a p_\beta^a + \mathbf{G}_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} Y_{\alpha\beta}^a p_\beta^a = 0, \tag{104}$$

$$\begin{aligned}
\text{quadratic} : & \mathcal{Y}_{\alpha\beta\gamma}^{ab} [p_\beta^{a-b}, p_\gamma^b] + \mathcal{Y}_{\alpha\beta\gamma}^{ab} [\mathbf{N}_{\beta\delta}^{a-b} \widehat{\mathbf{I}}_{\delta\alpha}^{a-b-1} Y_{\alpha\delta}^{a-b} p_\delta^{a-b}, p_\gamma^b] + \mathcal{Y}_{\alpha\beta\gamma}^{ab} [p_\beta^{a-b}, \mathbf{N}_{\gamma\delta}^b \widehat{\mathbf{I}}_{\delta\alpha}^{b-1} Y_{\alpha\delta}^b p_\delta^b] \\
& + Y_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} \mathbf{N}_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} \mathcal{Y}_{\alpha\beta\gamma}^{ab} [p_\beta^{a-b}, p_\gamma^b] + Y_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} \mathcal{C}_{\alpha\beta\gamma}^{ab} [\widehat{\mathbf{I}}_{\beta\alpha}^{a-b-1} Y_{\alpha\beta}^{\pm a-b} p_\beta^{a-b}, p_\gamma^b] \\
& - \mathcal{A}_{\alpha\beta\gamma}^{ab} [\widehat{\mathbf{I}}_{\beta\alpha}^{a-b-1} Y_{\alpha\beta}^{\pm a-b} p_\beta^{a-b}, \widehat{\mathbf{I}}_{\gamma\alpha}^{b-1} Y_{\alpha\gamma}^{\pm b} p_\gamma^b] - \mathcal{B}_{\alpha\beta\gamma}^{ab} [p_\beta^{a-b}, p_\gamma^b] - \varepsilon_{\alpha\beta\gamma}^{ab} [\widehat{\mathbf{I}}_{\beta\alpha}^{a-b-1} Y_{\alpha\beta}^{\pm a-b} p_\beta^{a-b}, p_\gamma^b] \\
& + \mathcal{Y}_{\alpha\beta\gamma}^{ab} [p_\beta^{a-b}, \mathbf{H}_{\gamma\delta}^b p_\delta^b] + \mathcal{Y}_{\alpha\beta\gamma}^{ab} [\mathbf{H}_{\beta\delta}^{a-b} p_\delta^{a-b}, p_\gamma^b] + \mathbf{G}_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} \mathcal{Y}_{\alpha\beta\gamma}^{ab} [p_\beta^{a-b}, p_\gamma^b] \\
& + Y_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} \mathcal{D}_{\alpha\beta\gamma}^{ab} [\widehat{\mathbf{I}}_{\beta\alpha}^{a-b-1} Y_{\alpha\beta}^{\pm a-b} p_\beta^{a-b}, \widehat{\mathbf{I}}_{\gamma\alpha}^{b-1} Y_{\alpha\gamma}^{\pm b} p_\gamma^b] = 0
\end{aligned} \tag{105}$$

As both of these equations hold true for a general p we can eliminate it to obtain an equation for the linear part of the admittance and an equation for the nonlinear part of the admittance:

$$\text{linear} - 2D : Y_{\alpha\beta}^a p_\beta^a + Y_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} \mathbf{N}_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} Y_{\alpha\beta}^a p_\beta^a + \mathbf{M}_{\alpha\beta}^a p_\beta^a + Y_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} \mathbf{H}_{\alpha\beta}^a p_\beta^a + \mathbf{G}_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} Y_{\alpha\beta}^a p_\beta^a = 0, \tag{106}$$

For quadratic, with:

$$\begin{aligned}
(\mathcal{A}[x, y])_\alpha^a &= (\mathcal{A}_{\alpha\beta\gamma}^{ab}[x_\beta^{a-b}, y_\gamma^b])_\alpha^a = \sum_{b=-\infty}^{\infty} \sum_{\beta, \gamma=0}^{\infty} A_{\alpha\beta\gamma}^{ab} x_\beta^{a-b} y_\gamma^b \\
(\mathcal{A}[X, Y])_{\alpha\beta\gamma}^{ab} &= (\mathcal{A}_{\alpha\delta\epsilon}^{ab}[X_{\delta\beta}^{a-b}, Y_{\epsilon\gamma}^b])_{\alpha\beta\gamma}^{ab} = \sum_{\delta, \epsilon=0}^{\infty} A_{\alpha\delta\epsilon}^{ab} X_{\delta\beta}^{a-b} Y_{\epsilon\gamma}^b \\
\text{Thus, } \{(\mathcal{A}[X, Y])_{\alpha\beta\gamma}^{ab}[x, y]\}_\alpha^a &= \{(\mathcal{A}_{\alpha\delta\epsilon}^{ab}[X_{\delta\beta}^{a-b}, Y_{\epsilon\gamma}^b])_{\alpha\beta\gamma}^{ab}[x_\beta^{a-b}, y_\gamma^b]\}_\alpha^a \\
&= \sum_{b=-\infty}^{\infty} \sum_{\beta, \gamma=0}^{\infty} \left(\sum_{\delta, \epsilon=0}^{\infty} A_{\alpha\delta\epsilon}^{ab} X_{\delta\beta}^{a-b} Y_{\epsilon\gamma}^b \right) x_\beta^{a-b} y_\gamma^b \\
&= \sum_{b=-\infty}^{\infty} \left\{ \sum_{\delta, \epsilon=0}^{\infty} A_{\alpha\delta\epsilon}^{ab} \left(\sum_{\beta} X_{\delta\beta}^{a-b} x_\beta^{a-b} \right)_\delta^{a-b} \left(\sum_{\gamma=0}^{\infty} Y_{\epsilon\gamma}^b y_\gamma^b \right)_\epsilon^b \right\} = \mathcal{A}[Xx, Yy]
\end{aligned} \tag{107}$$

We now can eliminate p, remaining 3-D tensors:

$$\begin{aligned}
\text{quadratic : } \mathcal{Y}_{\alpha\beta\gamma}^{'ab}[I_{\beta\delta} p_\delta^{a-b}, I_{\gamma\epsilon} p_\epsilon^b] &+ \mathcal{Y}_{\alpha\beta\gamma}^{ab}[\mathbf{N}_{\beta\delta}^{a-b} \widehat{\mathbf{I}}_{\delta\alpha}^{a-b} Y_{\alpha\delta}^{a-b} p_\delta^{a-b}, I_{\gamma\epsilon} p_\epsilon^b] + \mathcal{Y}_{\alpha\beta\gamma}^{ab}[I_{\beta\delta} p_\delta^{a-b}, \mathbf{N}_{\gamma\delta}^b \widehat{\mathbf{I}}_{\delta\alpha}^{b-1} Y_{\alpha\delta}^b p_\delta^b] \\
&+ Y_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} \mathbf{N}_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} \mathcal{Y}_{\alpha\beta\gamma}^{ab}[I_{\beta\delta} p_\delta^{a-b}, I_{\gamma\epsilon} p_\epsilon^b] + Y_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} \mathcal{C}_{\alpha\beta\gamma}^{ab}[\widehat{\mathbf{I}}_{\beta\alpha}^{a-b} Y_{\alpha\beta}^{\pm a-b} p_\beta^{a-b}, I_{\gamma\epsilon} p_\epsilon^b] \\
&- \mathcal{A}_{\alpha\beta\gamma}^{ab}[\widehat{\mathbf{I}}_{\beta\alpha}^{a-b} Y_{\alpha\beta}^{\pm a-b} p_\beta^{a-b}, \widehat{\mathbf{I}}_{\gamma\alpha}^{b-1} Y_{\alpha\gamma}^{\pm b} p_\gamma^b] - \mathcal{B}_{\alpha\beta\gamma}^{ab}[I_{\beta\delta} p_\delta^{a-b}, I_{\gamma\epsilon} p_\epsilon^b] - \varepsilon_{\alpha\beta\gamma}^{ab}[\widehat{\mathbf{I}}_{\beta\alpha}^{a-b} Y_{\alpha\beta}^{\pm a-b} p_\beta^{a-b}, I_{\gamma\epsilon} p_\epsilon^b] \\
&+ \mathcal{Y}_{\alpha\beta\gamma}^{ab}[I_{\beta\delta} p_\delta^{a-b}, \mathbf{H}_{\gamma\delta}^b p_\delta^b] + \mathcal{Y}_{\alpha\beta\gamma}^{ab}[\mathbf{H}_{\beta\delta}^{a-b} p_\delta^{a-b}, I_{\gamma\epsilon} p_\epsilon^b] + \mathbf{G}_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} \mathcal{Y}_{\alpha\beta\gamma}^{ab}[I_{\beta\delta} p_\delta^{a-b}, I_{\gamma\epsilon} p_\epsilon^b] \\
&+ Y_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} \mathcal{D}_{\alpha\beta\gamma}^{ab}[\widehat{\mathbf{I}}_{\beta\alpha}^{a-b} Y_{\alpha\beta}^{\pm a-b} p_\beta^{a-b}, \widehat{\mathbf{I}}_{\gamma\alpha}^{b-1} Y_{\alpha\gamma}^{\pm b} I_{\gamma\epsilon} p_\epsilon^b] = 0
\end{aligned} \tag{108}$$

\Rightarrow quadratic-rank 5 tensor(2 upper, 3 lower):

$$\begin{aligned}
(\mathcal{Y}_{\alpha\beta\gamma}^{'ab}[I_{\beta\delta}, I_{\gamma\epsilon}]_{\alpha\beta\gamma}^{ab})[p_\delta^{a-b}, p_\epsilon^b] &+ \mathcal{Y}_{\alpha\beta\gamma}^{ab}[\mathbf{N}_{\beta\delta}^{a-b} \widehat{\mathbf{I}}_{\delta\alpha}^{a-b} Y_{\alpha\delta}^{a-b}, I_{\gamma\epsilon}][p_\delta^{a-b}, p_\epsilon^b] + \mathcal{Y}_{\alpha\beta\gamma}^{ab}[I_{\beta\delta}, \mathbf{N}_{\gamma\delta}^b \widehat{\mathbf{I}}_{\delta\alpha}^{b-1} Y_{\alpha\delta}^b][p_\delta^{a-b}, p_\epsilon^b] \\
&+ Y_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} \mathbf{N}_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} \mathcal{Y}_{\alpha\beta\gamma}^{ab}[I_{\beta\delta}, I_{\gamma\epsilon}][p_\delta^{a-b}, p_\epsilon^b] + Y_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} \mathcal{C}_{\alpha\beta\gamma}^{ab}[\widehat{\mathbf{I}}_{\beta\alpha}^{a-b} Y_{\alpha\beta}^{\pm a-b}, I_{\gamma\epsilon}][p_\delta^{a-b}, p_\epsilon^b] \\
&- \mathcal{A}_{\alpha\beta\gamma}^{ab}[\widehat{\mathbf{I}}_{\beta\alpha}^{a-b} Y_{\alpha\beta}^{\pm a-b}, \widehat{\mathbf{I}}_{\gamma\alpha}^{b-1} Y_{\alpha\gamma}^{\pm b}][p_\delta^{a-b}, p_\epsilon^b] - \mathcal{B}_{\alpha\beta\gamma}^{ab}[I_{\beta\delta}, I_{\gamma\epsilon}][p_\delta^{a-b}, p_\epsilon^b] - \varepsilon_{\alpha\beta\gamma}^{ab}[\widehat{\mathbf{I}}_{\beta\alpha}^{a-b} Y_{\alpha\beta}^{\pm a-b}, I_{\gamma\epsilon}][p_\delta^{a-b}, p_\epsilon^b] \\
&+ \mathcal{Y}_{\alpha\beta\gamma}^{ab}[I_{\beta\delta}, \mathbf{H}_{\gamma\delta}^b p_\delta^b] + \mathcal{Y}_{\alpha\beta\gamma}^{ab}[\mathbf{H}_{\beta\delta}^{a-b} p_\delta^{a-b}, I_{\gamma\epsilon}][p_\delta^{a-b}, p_\epsilon^b] + \mathbf{G}_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} \mathcal{Y}_{\alpha\beta\gamma}^{ab}[I_{\beta\delta}, I_{\gamma\epsilon}][p_\delta^{a-b}, p_\epsilon^b] \\
&+ Y_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} \mathcal{D}_{\alpha\beta\gamma}^{ab}[\widehat{\mathbf{I}}_{\beta\alpha}^{a-b} Y_{\alpha\beta}^{\pm a-b}, \widehat{\mathbf{I}}_{\gamma\alpha}^{b-1} Y_{\alpha\gamma}^{\pm b} I_{\gamma\epsilon}][p_\delta^{a-b}, p_\epsilon^b] = 0
\end{aligned} \tag{109}$$

These equation are solved from the outlet of the duct, applying the appropriate radiation boundary condition at the duct exit. Once $\mathbf{Y}(s)$ and $\mathcal{Y}(s)$ are found through the duct, eq99 can then be used to replace the velocity modes with pressure modes in eq98, to obtain a numerically stable first

order ODE for the pressure modes:

$$\begin{aligned} \widehat{\mathbf{I}}_{\alpha\beta}^a p_\beta'^a &= \mathbf{N}_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} Y_{\alpha\beta}^a p_\beta^a + \mathbf{N}_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} \mathcal{Y}_{\alpha\beta\gamma}^{ab} [p_\beta^{a-b}, p_\gamma^b] \\ &+ \mathbf{H}_{\alpha\beta}^a p_\beta^a + \mathcal{C}_{\alpha\beta\gamma}^{ab} [\widehat{\mathbf{I}}_{\beta\alpha}^{a-b-1} Y_{\alpha\beta}^{\pm a-b} p_\beta^{a-b}, p_\gamma^b] + \mathcal{D}_{\alpha\beta\gamma}^{ab} [\widehat{\mathbf{I}}_{\beta\alpha}^{a-b-1} Y_{\alpha\beta}^{\pm a-b} p_\beta^{a-b}, \widehat{\mathbf{I}}_{\gamma\alpha}^{b-1} Y_{\alpha\gamma}^{\pm b} p_\gamma^b] \end{aligned} \quad (110)$$

This equation can be solved from the source to the outlet. As the equation involves the local admittance at each point, the solution includes both forward and backwards propagating waves together with their nonlinear interaction.

VII. Boundary Conditions for an infinite uniform duct outlet

The simplest boundary condition to consider for the admittance is that of an outlet consisting of an infinitely long uniform duct of constant curvature for which we have only propagating waves and decaying evanescent waves. In such a duct no point can be distinguished from another longitudinally, therefore we must have the admittance being a fixed point of the admittance equations. To find the fixed points, we begin by combining eq99, ignoring the quadratic terms for the moment, to form a second order ODE for the pressure modes, G,H, the derivatives of M and N vanish:

$$\begin{aligned} \widehat{\mathbf{I}}_{\alpha\beta}^a u_\beta'^a + \mathbf{M}_{\alpha\beta}^a p_\beta^a &= 0 \\ \widehat{\mathbf{I}}_{\alpha\beta}^a p_\beta'^a - \mathbf{N}_{\alpha\beta}^a u_\beta^a &= 0 \end{aligned} \quad (111)$$

$$\widehat{\mathbf{I}}_{\alpha\beta}^a p_\beta''^a(s) + \mathbf{N}_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} \mathbf{M}_{\alpha\beta}^a p_\beta^a(s) = 0 \quad (112)$$

$$\{v_i, -\lambda_i^2\} = \text{eig}(\mathbf{N}_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} \mathbf{M}_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1}), \text{suppose } \alpha = \beta \quad (113)$$

In matrix,

$$[\mathbf{N}_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1} \mathbf{M}_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{a-1}]_{\alpha \times \alpha} V = V \Lambda^2, V = [v_1, v_2, v_3, \dots], \Lambda = \text{diag}(i\lambda_1, i\lambda_2, \dots) \quad (114)$$

The solution in terms of forward and backward modes is given by:

$$p = p^+ + p^- = \sum_{k=1}^{\infty} (c_k^+ v_k e^{i\lambda_k s} + c_k^- v_k e^{-i\lambda_k s}) \quad (115)$$

where the v_i are the eigenvalue of NM with eigenvalues λ_i^2 , with arbitrary c_k^+ and c_k^- . Here, we have split the solution into forward and backward waves. The roots of the λ_k are chosen as follows:

$$\lambda_k = \begin{cases} (\lambda_k^2)^{1/2}, \lambda_k^2 > 0 \\ i(-\lambda_k^2)^{1/2}, \lambda_k^2 < 0 \end{cases} \quad (116)$$

to ensure either propagating or decaying evanescent modes in the positive direction. Based on extensive numerical evaluations, we observe that all of the eigenvectors of NM are real. We now introduce the characteristic forward and backwards admittance, linearly relating the forward and backwards modes:

$$\widehat{\mathbf{I}}_{\alpha\beta}^a u_{\beta}^{\pm a} = Y_{\alpha\beta}^{\pm a} p_{\beta}^{\pm a} \quad (117)$$

Using this, together with the linear equation relating pressure and velocity $(p_{\beta}^{\pm a})' = N_{\alpha\beta}^a u_{\beta}^{\pm a}$, we obtain an expression for $Y_{\alpha\beta}^{\pm a}$

$$(p_{\beta}^{\pm a}(s))' = N_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{-1} Y_{\alpha\beta}^{\pm a} p_{\beta}^{\pm a}(s) \quad (118)$$

Which is similar to above eig property, we have:

$$\begin{aligned} [N_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{-1} Y_{\alpha\beta}^{\pm a} \widehat{\mathbf{I}}_{\beta\alpha}^{-1}]_{\alpha \times \alpha} V &= \pm V \Lambda, V = [v_1, v_2, v_3, \dots], \Lambda = \text{diag}(i\lambda_1, i\lambda_2, \dots) \\ \Rightarrow Y_{\alpha\beta}^{\pm a} &= \pm \widehat{\mathbf{I}}_{\alpha\beta}^a N_{\beta\alpha}^a{}^{-1} V \Lambda V^{-1} \widehat{\mathbf{I}}_{\alpha\beta}^a = \pm \widehat{\mathbf{I}}_{\alpha\beta}^a N_{\beta\alpha}^a{}^{-1} \sqrt{V \Lambda^2 V^{-1}} \widehat{\mathbf{I}}_{\alpha\beta}^a = \pm i \widehat{\mathbf{I}}_{\alpha\beta}^a N_{\beta\alpha}^a{}^{-1} \sqrt{N_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{-1} \mathbf{M}_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{-1}} \widehat{\mathbf{I}}_{\alpha\beta}^a \end{aligned} \quad (119)$$

Substitute into eq, again ignoring G and H as the duct is assumed uniform:

$$\text{linear} - 2D : Y_{\alpha\beta}'^a + Y_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{-1} N_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{-1} Y_{\alpha\beta}^a + \mathbf{M}_{\alpha\beta}^a + Y_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{-1} \mathbf{H}_{\alpha\beta}^a + \mathbf{G}_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{-1} Y_{\alpha\beta}^a = 0, \quad (120)$$

$$Y_{\alpha\beta}'^a = \widehat{\mathbf{I}}_{\alpha\beta}^a N_{\beta\alpha}^a{}^{-1} \sqrt{N_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{-1} \mathbf{M}_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{-1} \widehat{\mathbf{I}}_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{-1} N_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{-1} \widehat{\mathbf{I}}_{\alpha\beta}^a} N_{\beta\alpha}^a{}^{-1} \sqrt{N_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{-1} \mathbf{M}_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{-1} \widehat{\mathbf{I}}_{\alpha\beta}^a} - M_{\alpha\beta}^a = 0 \quad (121)$$

Therefore, $Y = Y^+$ is the boundary condition applied at exit, implying only outgoing (not ingoing) propagating waves and decaying evanescent waves in the outlet.

Now, we introduce a matrix $W, =V$ with columns given by the eigenvectors of $Y^{\pm}N$ with corresponding eigenvalue matrix $\pm\Lambda$:

$$\begin{aligned} Y_{\alpha\beta}^{\pm a} &= \pm \widehat{\mathbf{I}}_{\alpha\beta}^a N_{\beta\alpha}^a{}^{-1} V_{\alpha \times \alpha}^a \Lambda_{\alpha \times \alpha}^a V_{\alpha \times \alpha}^a{}^{-1} \widehat{\mathbf{I}}_{\alpha\beta}^a \Rightarrow N_{\alpha\beta}^a \widehat{\mathbf{I}}_{\beta\alpha}^{-1} Y_{\alpha\beta}^{\pm a} \widehat{\mathbf{I}}_{\beta\alpha}^{-1} V_{\alpha \times \alpha}^a = \pm V_{\alpha \times \alpha}^a \Lambda_{\alpha \times \alpha}^a \\ Y_{\alpha\beta}^{\pm a} &= \pm \widehat{\mathbf{I}}_{\alpha\beta}^a W_{\beta \times \beta}^a \Lambda_{\beta \times \beta}^a W_{\beta \times \beta}^a{}^{-1} N_{\beta\alpha}^a{}^{-1} \widehat{\mathbf{I}}_{\alpha\beta}^a \Rightarrow \end{aligned} \quad (122)$$

We know that:

$$\begin{aligned}
(\mathcal{A}[x, y])_\alpha^a &= (\mathcal{A}_{\alpha\beta\gamma}^{ab}[x_\beta^{a-b}, y_\gamma^b])_\alpha^a = \sum_{b=-\infty}^{\infty} \sum_{\beta, \gamma=0}^{\infty} A_{\alpha\beta\gamma}^{ab} x_\beta^{a-b} y_\gamma^b \\
\underbrace{(\mathcal{A}[X, Y])_{\alpha\beta\gamma}^{ab}} &= (\mathcal{A}_{\alpha\delta\epsilon}^{ab}[X_{\delta\beta}^{a-b}, Y_{\epsilon\gamma}^b])_{\alpha\beta\gamma}^{ab} = \sum_{\delta, \epsilon=0}^{\infty} A_{\alpha\delta\epsilon}^{ab} X_{\delta\beta}^{a-b} Y_{\epsilon\gamma}^b \\
\text{Thus, } \{(\mathcal{A}[X1, Y1])_{\alpha\beta\gamma}^{ab}[X2, Y2]\}_{\alpha\delta\epsilon}^{ab} &= ((\mathcal{A}_{\alpha\delta\epsilon}^{ab}[X1_{\delta\beta}^{a-b}, Y1_{\epsilon\gamma}^b])_{\alpha\beta\gamma}^{ab}[X2_{\beta\delta}^{a-b}, Y2_{\gamma\epsilon}^b])_{\alpha\delta\epsilon}^{ab} \\
&= \sum_{\beta, \gamma=0}^{\infty} \left(\sum_{\delta, \epsilon=0}^{\infty} A_{\alpha\delta\epsilon}^{ab} X1_{\delta\beta}^{a-b} Y1_{\epsilon\gamma}^b \right) X2_{\beta\delta}^{a-b} Y2_{\gamma\epsilon}^b \\
&= \sum_{\delta, \epsilon=0}^{\infty} \{A_{\alpha\delta\epsilon}^{ab} \sum_{\beta=0}^{\infty} (X1_{\delta\beta}^{a-b} X2_{\beta\delta}^{a-b}) \sum_{\gamma=0}^{\infty} (Y1_{\epsilon\gamma}^b Y2_{\gamma\epsilon}^b)\} \\
&= (\mathcal{A}_{\alpha\delta\epsilon}^{ab}[X1_{\delta\beta}^{a-b} X2_{\beta\delta}^{a-b}, Y1_{\epsilon\gamma}^b Y2_{\gamma\epsilon}^b])_{\alpha\delta\epsilon}^{ab}
\end{aligned} \tag{123}$$

With $\varepsilon = 0, G = 0, H = 0, \mathcal{Y}' = 0$, fix points of the nonlinear admittance equation satisfy:

$$\begin{aligned}
&\mathcal{Y}_{\alpha\beta\gamma}^{ab}[\mathbf{N}_{\beta\delta}^{a-b} \widehat{\mathbf{I}_{\delta\alpha}^{a-b}}^{-1} Y_{\alpha\delta}^{a-b}, I_{\gamma\epsilon}] + \mathcal{Y}_{\alpha\beta\gamma}^{ab}[I_{\beta\delta}, \mathbf{N}_{\gamma\delta}^b \widehat{\mathbf{I}_{\delta\alpha}^b}^{-1} Y_{\alpha\delta}^b] \\
&+ Y_{\alpha\beta}^a \widehat{\mathbf{I}_{\beta\alpha}^a}^{-1} \mathbf{N}_{\alpha\beta}^a \widehat{\mathbf{I}_{\beta\alpha}^a}^{-1} \mathcal{Y}_{\alpha\beta\gamma}^{ab}[I_{\beta\delta}, I_{\gamma\epsilon}] + Y_{\alpha\beta}^a \widehat{\mathbf{I}_{\beta\alpha}^a}^{-1} \mathcal{C}_{\alpha\beta\gamma}^{ab}[\widehat{\mathbf{I}_{\beta\alpha}^{a-b}}^{-1} Y_{\alpha\beta}^{\pm a-b}, I_{\gamma\epsilon}] \\
&- \mathcal{A}_{\alpha\beta\gamma}^{ab}[\widehat{\mathbf{I}_{\beta\alpha}^{a-b}}^{-1} Y_{\alpha\beta}^{\pm a-b}, \widehat{\mathbf{I}_{\gamma\alpha}^b}^{-1} Y_{\alpha\gamma}^{\pm b}] - \mathcal{B}_{\alpha\beta\gamma}^{ab}[I_{\beta\delta}, I_{\gamma\epsilon}] = 0
\end{aligned} \tag{124}$$

We apply $\{W_{\alpha\xi}^a\}^{-1}$ on the left of this equation and $V_{\alpha\beta}^a$ to the right on both terms in the square brackets:

$$\begin{aligned}
&W^{-1a}_{\xi\alpha} \mathcal{Y}_{\alpha\beta\gamma}^{\pm ab}[\mathbf{N}_{\beta\delta}^{a-b} \widehat{\mathbf{I}_{\delta\alpha}^{a-b}}^{-1} Y_{\alpha\delta}^{a-b} V, I_{\gamma\epsilon} V] + W^{-1a}_{\xi\alpha} \mathcal{Y}_{\alpha\beta\gamma}^{\pm ab}[I_{\beta\delta} V, \mathbf{N}_{\gamma\delta}^b \widehat{\mathbf{I}_{\delta\alpha}^b}^{-1} Y_{\alpha\delta}^b V] \\
&+ W^{-1a}_{\xi\alpha} Y_{\alpha\beta}^{\pm a} \widehat{\mathbf{I}_{\beta\alpha}^a}^{-1} \mathbf{N}_{\alpha\beta}^a \widehat{\mathbf{I}_{\beta\alpha}^a}^{-1} \mathcal{Y}_{\alpha\beta\gamma}^{ab}[I_{\beta\delta} V, I_{\gamma\epsilon} V] + W^{-1a}_{\xi\alpha} Y_{\alpha\beta}^{\pm a} \widehat{\mathbf{I}_{\beta\alpha}^a}^{-1} \mathcal{C}_{\alpha\beta\gamma}^{ab}[\widehat{\mathbf{I}_{\beta\alpha}^{a-b}}^{-1} Y_{\alpha\beta}^{\pm a-b} V, I_{\gamma\epsilon} V] \\
&- W^{-1a}_{\xi\alpha} \mathcal{A}_{\alpha\beta\gamma}^{ab}[\widehat{\mathbf{I}_{\beta\alpha}^{a-b}}^{-1} Y_{\alpha\beta}^{\pm a-b} V, \widehat{\mathbf{I}_{\gamma\alpha}^b}^{-1} Y_{\alpha\gamma}^{\pm b} V] - W^{-1a}_{\xi\alpha} \mathcal{B}_{\alpha\beta\gamma}^{ab}[I_{\beta\delta} V, I_{\gamma\epsilon} V] = 0
\end{aligned} \tag{125}$$

$$\begin{aligned}
&W^{-1a}_{\xi\alpha} \mathcal{Y}_{\alpha\beta\gamma}^{\pm ab}[\pm(V\Lambda)_{\beta\delta}^{a-b}, V_{\gamma\epsilon}^b] + W^{-1a}_{\xi\alpha} \mathcal{Y}_{\alpha\beta\gamma}^{\pm ab}[V_{\beta\delta}^{a-b}, \pm(V\Lambda)_{\gamma\epsilon}^b] \\
&+ W^{-1a}_{\xi\alpha} Y_{\alpha\beta}^{\pm a} \widehat{\mathbf{I}_{\beta\alpha}^a}^{-1} \mathbf{N}_{\alpha\beta}^a \widehat{\mathbf{I}_{\beta\alpha}^a}^{-1} \mathcal{Y}_{\alpha\beta\gamma}^{\pm ab}[V_{\beta\delta}^{a-b}, V_{\gamma\epsilon}^b] + W^{-1a}_{\xi\alpha} Y_{\alpha\beta}^{\pm a} \widehat{\mathbf{I}_{\beta\alpha}^a}^{-1} \mathcal{C}_{\alpha\beta\gamma}^{ab}[\widehat{\mathbf{I}_{\beta\alpha}^{a-b}}^{-1} Y_{\alpha\beta}^{\pm a-b} V_{\beta\delta}^{a-b}, V_{\gamma\epsilon}^b] \\
&- W^{-1a}_{\xi\alpha} \mathcal{A}_{\alpha\beta\gamma}^{ab}[\widehat{\mathbf{I}_{\beta\alpha}^{a-b}}^{-1} Y_{\alpha\beta}^{\pm a-b} V_{\beta\delta}^{a-b}, \widehat{\mathbf{I}_{\gamma\alpha}^b}^{-1} Y_{\alpha\gamma}^{\pm b} V_{\gamma\epsilon}^b] - W^{-1a}_{\xi\alpha} \mathcal{B}_{\alpha\beta\gamma}^{ab}[V_{\beta\delta}^{a-b}, I_{\gamma\epsilon} V_{\gamma\epsilon}^b] = 0
\end{aligned} \tag{126}$$

Next, we transform \mathcal{Y}^\pm in the following manner:

$$\mathcal{Y}^\pm[x, y] = W \tilde{\mathcal{Y}}^\pm[V^{-1}x, V^{-1}y] \tag{127}$$

Fig. 1 3D – model – lambda

$$\begin{aligned}
& \tilde{\mathcal{Y}}_{\alpha\beta\gamma}^{\pm ab}[\pm(\Lambda)_{\beta\delta}^{a-b}, I_{\gamma\epsilon}^b] + \tilde{\mathcal{Y}}_{\alpha\beta\gamma}^{\pm ab}[I_{\beta\delta}^{a-b}, \pm(\Lambda)_{\gamma\epsilon}^b] \pm \Lambda_{\xi\alpha} \tilde{\mathcal{Y}}_{\alpha\beta\gamma}^{\pm ab}[I_{\beta\delta}^{a-b}, I_{\gamma\epsilon}^b] \\
& + W^{-1a}_{\xi\alpha} Y_{\alpha\beta}^{\pm a} \widehat{\mathbf{I}}_{\beta\alpha}^{-1} \mathcal{C}_{\alpha\beta\gamma}^{ab}[\widehat{\mathbf{I}}_{\beta\alpha}^{a-b}]^{-1} Y_{\alpha\beta}^{\pm a-b} V_{\beta\delta}^{a-b}, V_{\gamma\epsilon}^b] \\
& - W^{-1a}_{\xi\alpha} \mathcal{A}_{\alpha\beta\gamma}^{ab}[\widehat{\mathbf{I}}_{\beta\alpha}^{a-b}]^{-1} Y_{\alpha\beta}^{\pm a-b} V_{\beta\delta}^{a-b}, \widehat{\mathbf{I}}_{\gamma\alpha}^b]^{-1} Y_{\alpha\gamma}^{\pm b} V_{\gamma\epsilon}^b] - W^{-1a}_{\xi\alpha} \mathcal{B}_{\alpha\beta\gamma}^{ab}[V_{\beta\delta}^{a-b}, I_{\gamma\epsilon} V_{\gamma\epsilon}^b] = 0
\end{aligned} \tag{128}$$

$$\begin{aligned}
& \tilde{\mathcal{Y}}_{\alpha\beta\gamma}^{\pm ab} = \frac{1}{\pm i\lambda_{\alpha}^a \pm i\lambda_{\beta}^{a-b} \pm i\lambda_{\gamma}^b} (-W^{-1a}_{\xi\alpha} Y_{\alpha\beta}^{\pm a} \widehat{\mathbf{I}}_{\beta\alpha}^{-1} \mathcal{C}_{\alpha\beta\gamma}^{ab}[\widehat{\mathbf{I}}_{\beta\alpha}^{a-b}]^{-1} Y_{\alpha\beta}^{\pm a-b} V_{\beta\delta}^{a-b}, V_{\gamma\epsilon}^b] \\
& + W^{-1a}_{\xi\alpha} \mathcal{A}_{\alpha\beta\gamma}^{ab}[\widehat{\mathbf{I}}_{\beta\alpha}^{a-b}]^{-1} Y_{\alpha\beta}^{\pm a-b} V_{\beta\delta}^{a-b}, \widehat{\mathbf{I}}_{\gamma\alpha}^b]^{-1} Y_{\alpha\gamma}^{\pm b} V_{\gamma\epsilon}^b] + W^{-1a}_{\xi\alpha} \mathcal{B}_{\alpha\beta\gamma}^{ab}[V_{\beta\delta}^{a-b}, I_{\gamma\epsilon} V_{\gamma\epsilon}^b])_{\alpha\beta\gamma}^{ab}
\end{aligned} \tag{129}$$

VIII. Boundary Conditions for an infinite Helical duct outlet

We begin by considering the linear forms of equation eq98:

$$\begin{pmatrix} u \\ p \end{pmatrix}' = \begin{pmatrix} -G & -M \\ N & H \end{pmatrix} \begin{pmatrix} u \\ p \end{pmatrix} = L \begin{pmatrix} u \\ p \end{pmatrix} \tag{130}$$

$$\begin{pmatrix} u \\ p \end{pmatrix}'' = L^2 \begin{pmatrix} u \\ p \end{pmatrix} = \begin{pmatrix} -(G^2 - MN) & (GM - MH) \\ (HN - NG) & (H^2 - NM) \end{pmatrix} \begin{pmatrix} u \\ p \end{pmatrix} \tag{131}$$

This equation can be solved by $u = \sum v_i^u e^{\lambda_i s}$ and $p = \sum v_i^p e^{\lambda_i s}$, similarly, we have:

$$\left\{ \begin{pmatrix} v_i^u \\ v_i^p \end{pmatrix}, \lambda_i \right\} = eig(L) \tag{132}$$

$$\left\{ \begin{pmatrix} v_i^u \\ v_i^p \end{pmatrix}, \lambda_i^2 \right\} = eig(L^2) \tag{133}$$

IX. Separating the Ψ integrals into radial and angular parts

With $\int_0^{2\pi} e^{im\phi} e^{-im\theta} d\theta = 2\pi$, $\psi_{\alpha_{m\mu}}(r) = C_{\alpha_{m\mu}} J_m(\frac{j'_{m\mu} r}{h}) e^{im\phi}$, we have:

$$C_{\alpha_{m\mu}} = \frac{(i)^m}{\sqrt{(\pi h^2 (1 - \frac{m^2}{j'^2_{m\mu}}) J_m^2(j'_{m\mu}))}}$$

$$\text{except for : } C_{\alpha_{01}} = \frac{1}{\sqrt{\pi h}}$$
(134)

$$\psi_{\alpha_{m\mu}}(r) = C_{\alpha_{m\mu}} J_m(\frac{j'_{m\mu} r}{h}) e^{im\phi}$$
(135)

By normolization, h is not bother the equation of I:

$$\int_0^h C_1 C_2 J_1 J_2 r dr = \int_0^1 \frac{C_1^\#}{h} \frac{C_2^\#}{h} J_1(j'_1 z) J_2(j'_2 z) z h h dz = \int_0^1 C_1^\# C_2^\# 2 J_1(j'_1 z) J_2(j'_2 z) z dz.$$

$$\int_0^h C_1 C_2 C_3 J_1 J_2 J_3 r dr = \int_0^1 \frac{C_1^\#}{h} \frac{C_2^\#}{h} \frac{C_3^\#}{h} J_1(j'_1 z) J_2(j'_2 z) J_3(j'_3 z) z h h dz = \frac{1}{h} \int_0^1 C_1^\# C_2^\# C_3^\# 2 J_1(j'_1 z) J_2(j'_2 z) J_3(j'_3 z) z dz.$$

Which this derivation could be used to simplify the code.

$$\Psi_{[\alpha](\beta)\gamma}[r(1 - \kappa r \cos\phi)] = \int_0^{2\pi} \int_0^h [\frac{\partial \psi_\alpha}{\partial r}] [\frac{\partial \psi_\beta}{\partial \theta}] \psi_\gamma[r(1 - \kappa r \cos\phi)] dr d\theta$$

$$= \mathcal{X}_{[\alpha]\beta\gamma}[r] \Theta_{\alpha(\beta)\gamma} - \kappa \mathcal{X}_{[\alpha]\beta\gamma}[r^2] \Theta_{\alpha(\beta)\gamma}[\cos\phi]$$
(136)

with:

$$\mathcal{X}_{[\alpha]\beta\gamma} = \int_0^h \frac{d}{dr} (C_{\alpha_{m\mu}} J_m(\frac{j'_{\alpha_{m\mu}} r}{h})) C_{\beta_{nv}} J_n(\frac{j'_{\beta_{nv}} r}{h}) C_{\gamma_{kw}} J_k(\frac{j'_{\gamma_{kw}} r}{h}) dr$$

$$\Theta_{\alpha(\beta)\gamma} = \int_0^{2\pi} e^{im\phi} \frac{d}{d\theta} (e^{in\phi}) e^{ik\phi} d\theta$$
(137)

Bessel function recurrence relations are:

$$J_{m-1}(x) + J_{m+1}(x) = 2m/x J_m(x)$$

$$J_{m-1}(x) - J_{m+1}(x) = 2J'_m(x)$$
(138)

we can have:

$$2J_{m+1}(x) = 2m/x J_m(x) - 2J'_m(x) \rightarrow$$

$$J'_m(x) = m/x J_m(x) - J_{m+1}(x)$$
(139)

$$\mathcal{X}_{[\alpha]\beta}[r] = \int_0^h \frac{d}{dr} (C_{\alpha_{m\mu}} J_m(\frac{j'_{\alpha_{m\mu}} r}{h})) C_{\beta_{nv}} J_n(\frac{j'_{\beta_{nv}} r}{h}) r dr$$

$$= \int_0^h \frac{j'_{\alpha_{m\mu}}}{h} C_{\alpha_{m\mu}} [\frac{m}{j'_{\alpha_{m\mu}} r/h} J_m(\frac{j'_{\alpha_{m\mu}} r}{h}) - J_{m+1}(\frac{j'_{\alpha_{m\mu}} r}{h})] C_{\beta_{nv}} J_n(\frac{j'_{\beta_{nv}} r}{h}) r dr$$

$$= C_{\alpha_{m\mu}} C_{\beta_{nv}} \int_0^h [m J_m(\frac{j'_{\alpha_{m\mu}} r}{h}) - \frac{j'_{\alpha_{m\mu}} r}{h} J_{m+1}(\frac{j'_{\alpha_{m\mu}} r}{h})] J_n(\frac{j'_{\beta_{nv}} r}{h}) dr$$
(140)

The Θ integrals can be calculated analytically:

$$\Theta_{\alpha\beta} = \int_0^{2\pi} e^{im\phi} e^{in\phi} d\theta = \begin{cases} 0 \\ 2\pi, m+n=0 \end{cases} = 2\pi\delta_{m,-n} \quad (141)$$

With Euler's equation:

$$\begin{aligned} e^{ix} &= \cos x + i \sin x \\ \cos x &= [e^{ix} + e^{-ix}]/2 \\ \sin x &= [e^{ix} - e^{-ix}]/2i \end{aligned} \quad (142)$$

$$\begin{aligned} \Theta_{\alpha\beta}[\cos\phi] &= \int_0^{2\pi} \cos(\theta - \theta_0) e^{im\phi} e^{in\phi} d\theta = 1/2 \int_0^{2\pi} [e^{i(\theta-\theta_0)} + e^{-i(\theta-\theta_0)}] e^{im\phi} e^{in\phi} d\theta \\ &= 1/2 \int_0^{2\pi} e^{i(\theta-\theta_0)} e^{im\phi} e^{in\phi} d\theta + 1/2 \int_0^{2\pi} [e^{-i(\theta-\theta_0)}] e^{im\phi} e^{in\phi} d\theta \\ &= \pi e^{-i(1+m+n)\theta_0} \delta_{m,-n-1} + \pi e^{i(m+n-1)\theta_0} \delta_{m,-n+1} \\ &= \pi\delta_{m,-n-1} + \pi\delta_{m,-n+1} \end{aligned} \quad (143)$$

$$\Theta_{(\alpha)\beta} = \int_0^{2\pi} \frac{\partial}{\partial\theta} (e^{im\phi}) e^{in\phi} d\theta = 2\pi im\delta_{m,-n} \quad (144)$$

$$\Theta_{(\alpha)\beta}[\cos\phi] = im[\pi\delta_{m,-n-1} + \pi\delta_{m,-n+1}] \quad (145)$$

$$\Theta_{\alpha\beta\gamma} = \int_0^{2\pi} e^{im\phi} e^{in\phi} e^{ik\theta} d\theta = 2\pi\delta_{m,-n,-k} \quad (146)$$

$$\Theta_{\alpha\beta\gamma}[\cos\phi] = 1/2 \int_0^{2\pi} [e^{i(\theta-\theta_0)} + e^{-i(\theta-\theta_0)}] e^{im\phi} e^{in\phi} e^{ik\theta} d\theta = \pi\delta_{m,-n,-k-1} + \pi\delta_{m,-n,-k+1} \quad (147)$$

$$\begin{aligned} \Theta_{\alpha\beta\gamma}[\sin\phi] &= 1/(2i) \int_0^{2\pi} [e^{i(\theta-\theta_0)} - e^{-i(\theta-\theta_0)}] e^{im\phi} e^{in\phi} e^{ik\theta} d\theta = -i[\pi\delta_{m,-n,-k-1} - \pi\delta_{m,-n,-k+1}] \\ & \quad (148) \end{aligned}$$

$$\Theta_{(\alpha)\beta\gamma} = im \int_0^{2\pi} e^{im\phi} e^{in\phi} e^{ik\phi} d\theta = 2\pi im \delta_{m,-n,-k} \quad (149)$$

$$\Theta_{(\alpha)\beta\gamma}[\cos\phi] = 1/2 \int_0^{2\pi} [e^{i(\theta-\theta_0)} + e^{-i(\theta-\theta_0)}] e^{im\phi} e^{in\phi} e^{ik\phi} d\theta = im[\pi\delta_{m,-n,-k-1} + \pi\delta_{m,-n,-k+1}] \quad (150)$$

We also have:

$$\Psi_{\{\alpha\}\beta} = \mathcal{X}_{\{\alpha\}\beta} \Theta_{\alpha\beta} + \mathcal{X}_{\alpha\beta} \Theta_{\{\alpha\}\beta} \quad (151)$$

with:

$$\begin{aligned} \mathcal{X}_{\{\alpha\}\beta} &= \int_0^h \frac{d}{ds} (C_{\alpha_{m\mu}}(s) J_m(\frac{j'_{\alpha_{m\mu}} r}{h(s)})) C_{\beta_{nv}} J_n(\frac{j'_{\beta_{nv}} r}{h}) dr \\ &= \int_0^h [(\frac{dC_{\alpha_{m\mu}}(s)}{ds}) J_m(\frac{j'_{\alpha_{m\mu}} r}{h(s)}) + C_{\alpha_{m\mu}} J_m(\frac{j'_{\alpha_{m\mu}} r}{h(s)}) \frac{-j'_{\alpha_{m\mu}} r}{h(s)^2} \frac{dh(s)}{ds}] C_{\beta_{nv}} J_n(\frac{j'_{\beta_{nv}} r}{h}) dr \\ &= \int_0^h [(\frac{d\frac{1}{h(s)}}{ds}) C_{\alpha_{m\mu}}(s) J_m(\frac{j'_{\alpha_{m\mu}} r}{h(s)}) + C_{\alpha_{m\mu}} J_m(\frac{j'_{\alpha_{m\mu}} r}{h(s)}) \frac{-j'_{\alpha_{m\mu}} r}{h(s)^2} \frac{dh(s)}{ds}] C_{\beta_{nv}} J_n(\frac{j'_{\beta_{nv}} r}{h}) dr \\ &= \int_0^h [(-\frac{h'(s)}{h}) C_{\alpha_{m\mu}}(s) J_m(\frac{j'_{\alpha_{m\mu}} r}{h(s)}) - C_{\alpha_{m\mu}} \frac{\partial}{\partial r} (J_m(\frac{j'_{\alpha_{m\mu}} r}{h(s)})) \frac{h'(s)}{h} r] C_{\beta_{nv}} J_n(\frac{j'_{\beta_{nv}} r}{h}) dr \\ &= -\frac{h'}{h} (\mathcal{X}_{[\alpha]\beta}[r] + \mathcal{X}_{\alpha\beta}) \end{aligned} \quad (152)$$

$$\begin{aligned} \mathcal{X}_{\{\alpha\}\beta}[r] &= \int_0^h \frac{d}{ds} (C_{\alpha_{m\mu}}(s) J_m(\frac{j'_{\alpha_{m\mu}} r}{h(s)})) C_{\beta_{nv}} J_n(\frac{j'_{\beta_{nv}} r}{h}) r dr \\ &= \int_0^h [(\frac{dC_{\alpha_{m\mu}}(s)}{ds}) J_m(\frac{j'_{\alpha_{m\mu}} r}{h(s)}) + C_{\alpha_{m\mu}} J_m(\frac{j'_{\alpha_{m\mu}} r}{h(s)}) \frac{-j'_{\alpha_{m\mu}} r}{h(s)^2} \frac{dh(s)}{ds}] C_{\beta_{nv}} J_n(\frac{j'_{\beta_{nv}} r}{h}) r dr \\ &= \int_0^h [(\frac{d\frac{1}{h(s)}}{ds}) C_{\alpha_{m\mu}}(s) J_m(\frac{j'_{\alpha_{m\mu}} r}{h(s)}) + C_{\alpha_{m\mu}} J_m(\frac{j'_{\alpha_{m\mu}} r}{h(s)}) \frac{-j'_{\alpha_{m\mu}} r}{h(s)^2} \frac{dh(s)}{ds}] C_{\beta_{nv}} J_n(\frac{j'_{\beta_{nv}} r}{h}) r dr \\ &= \int_0^h [(-\frac{h'(s)}{h}) C_{\alpha_{m\mu}}(s) J_m(\frac{j'_{\alpha_{m\mu}} r}{h(s)}) - C_{\alpha_{m\mu}} \frac{\partial}{\partial r} (J_m(\frac{j'_{\alpha_{m\mu}} r}{h(s)})) \frac{h'(s)}{h} r] C_{\beta_{nv}} J_n(\frac{j'_{\beta_{nv}} r}{h}) r dr \\ &= -\frac{h'}{h} (\mathcal{X}_{[\alpha]\beta}[r^2] + \mathcal{X}_{\alpha\beta}[r]) \end{aligned} \quad (153)$$

$$\begin{aligned}
\mathcal{X}_{\{\alpha\}\beta\gamma} &= \int_0^h \frac{d}{ds} (C_{\alpha m\mu}(s) J_m(\frac{j'_{\alpha m\mu} r}{h(s)})) C_{\beta nv} J_n(\frac{j'_{\beta nv} r}{h}) C_{\gamma kw} J_n(\frac{j'_{\gamma kw} r}{h}) dr \\
&= \int_0^h [(\frac{dC_{\alpha m\mu}(s)}{ds}) J_m(\frac{j'_{\alpha m\mu} r}{h(s)}) + C_{\alpha m\mu} J_m(\frac{j'_{\alpha m\mu} r}{h(s)}) \frac{-j'_{\alpha m\mu} r}{h(s)^2} \frac{dh(s)}{ds}] C_{\beta nv} J_n(\frac{j'_{\beta nv} r}{h}) C_{\gamma kw} J_n(\frac{j'_{\gamma kw} r}{h}) dr \\
&= \int_0^h [(\frac{d}{ds} \frac{1}{h(s)}) C_{\alpha m\mu}(s) J_m(\frac{j'_{\alpha m\mu} r}{h(s)}) + C_{\alpha m\mu} J_m(\frac{j'_{\alpha m\mu} r}{h(s)}) \frac{-j'_{\alpha m\mu} r}{h(s)^2} \frac{dh(s)}{ds}] C_{\beta nv} J_n(\frac{j'_{\beta nv} r}{h}) C_{\gamma kw} J_n(\frac{j'_{\gamma kw} r}{h}) dr \\
&= \int_0^h [(-\frac{h'(s)}{h}) C_{\alpha m\mu}(s) J_m(\frac{j'_{\alpha m\mu} r}{h(s)}) - C_{\alpha m\mu} \frac{\partial}{\partial r} (J_m(\frac{j'_{\alpha m\mu} r}{h(s)})) \frac{h'(s)}{h} r] C_{\beta nv} J_n(\frac{j'_{\beta nv} r}{h}) C_{\gamma kw} J_n(\frac{j'_{\gamma kw} r}{h}) dr \\
&= -\frac{h'}{h} (\mathcal{X}_{[\alpha]\beta\gamma}[r] + \mathcal{X}_{\alpha\beta\gamma})
\end{aligned} \tag{154}$$

$$\begin{aligned}
\Theta_{\{\alpha\}\beta} &= \int_0^{2\pi} \frac{\partial}{\partial s} (e^{im\phi}) e^{in\phi} d\theta = -im \int_0^{2\pi} \frac{\partial \theta_0(s)}{\partial s} e^{im\phi} e^{in\phi} d\theta \\
&= -\tau \Theta_{(\alpha)\beta} = -\tau 2\pi i n \delta_{m,-n}
\end{aligned} \tag{155}$$

$$\Theta_{\alpha\{\beta\}} = -\tau \Theta_{\alpha(\beta)} = -\tau 2\pi i n \delta_{m,-n} \tag{156}$$

Similarly,

$$\frac{d}{ds} (\Psi_{\alpha\beta\gamma}[r]) = \frac{d}{ds} (\mathcal{X}_{\alpha\beta\gamma}[r]) \Theta_{\alpha\beta\gamma} \tag{157}$$

$$\frac{d}{ds} (\int_0^{h(s)} f(r, s) dr) = \int_0^{h(s)} \frac{\partial}{\partial \alpha} f(r, s) dr + \frac{dh(s)}{ds} f(h(s), s) \tag{158}$$

with

$$\begin{aligned}
\frac{d}{ds} (\mathcal{X}_{\alpha\beta\gamma}[r]) &= \mathcal{X}_{\{\alpha\}\beta\gamma}[r] + \mathcal{X}_{\alpha\{\beta\}\gamma}[r] + \mathcal{X}_{\alpha\beta\{\gamma\}}[r] \\
&\quad + h' h [C_{\alpha m\mu}(s) J_m(\frac{j'_{\alpha m\mu} r}{h(s)}) C_{\beta nv} J_n(\frac{j'_{\beta nv} r}{h}) C_{\gamma kw} J_n(\frac{j'_{\gamma kw} r}{h})] \\
&= -\frac{h'}{h} (\mathcal{X}_{[\alpha]\beta\gamma}[r^2]) - \frac{h'}{h} (\mathcal{X}_{\alpha[\beta]\gamma}[r^2]) - \frac{h'}{h} (\mathcal{X}_{\alpha\beta[\gamma]}[r^2]) - 3 \frac{h'}{h} \mathcal{X}_{\alpha\beta\gamma}[r] \\
&\quad + h' h C_{\alpha m\mu}(s) J_m(j'_{\alpha m\mu}) C_{\beta nv} J_n(j'_{\beta nv}) C_{\gamma kw} J_n(j'_{\gamma kw})

X. Tensors in matlab for numerical simulation

A. Tensor times vectors: $\mathcal{A} \bar{\times}_n u$

Let \mathcal{A} be a tensor of size $I_1 \times I_2 \times \dots \times I_N$, u be a vector of size I_n .

We have:

$$\begin{aligned}
ttv(\mathcal{A}, \{u\}, [n]) &= (\mathcal{A} \bar{\times}_n u)(i_1, \dots, i_{n-1}, i_{n+1}, \dots, i_N) \\
&= \sum_{i_n=1}^{I_n} \mathcal{A}(i_1, i_2, \dots, i_N) u(i_n)
\end{aligned} \tag{161}$$

$$ttv(A_{m \times n}, \{u_{m \times 1}\}, [1]) = A_{m \times n} \bar{\times}_1 u_{m \times 1} = A_{m \times n}^T u_{m \times 1} \tag{162}$$

$$ttv(A_{m \times n}, \{v_{n \times 1}\}, [2]) = A_{m \times n} \bar{\times}_2 v_{n \times 1} = A_{m \times n} v_{n \times 1}$$

Property:

$$\begin{aligned}
ttv(\mathcal{A}, \{u, v\}, [m, n]) &= \mathcal{A} \bar{\times}_m u \bar{\times}_n v \\
&= ttv(ttv(\mathcal{A}, \{u\}, [m]), \{v\}, [n-1]) = (\mathcal{A} \bar{\times}_m u) \bar{\times}_{n-1} v \\
&= ttv(ttv(\mathcal{A}, \{v\}, [v]), \{u\}, [m]) = (\mathcal{A} \bar{\times}_n v) \bar{\times}_m u
\end{aligned} \tag{163}$$

Multiplication with a sequence of vectors

$$\beta = \mathcal{A} \bar{\times}_1 u^{(1)} \bar{\times}_2 u^{(2)} \dots \bar{\times}_N u^{(N)} = \mathcal{A} \bar{\times} u \tag{164}$$

$$like : ttv(X, \{A, B, C, D\}) = ttv(X, \{A, B, C, D\}, [1234]) = ttv(X, \{D, C, B, A\}, [4321])$$

Multiplication with **all but one** of a sequence of vectors

$$\begin{aligned}
b &= \mathcal{A} \bar{\times}_1 u^{(1)} \bar{\times}_2 u^{(2)} \dots \bar{\times}_{n-1} u^{(2)} \bar{\times}_{n+1} u^{(2)} \dots \bar{\times}_N u^{(N)} = \mathcal{A} \bar{\times}_{-n} u \\
like : X &= tenrand([5, 3, 4, 2]); \\
A &= rand(5, 1); B = rand(3, 1); C = rand(4, 1); D = rand(2, 1); \\
Y &= ttv(X, \{A, B, D\}, -3) = ttv(X, \{A, B, C, D\}, -3)
\end{aligned} \tag{165}$$

B. Tensor times matrix (ttm): $\mathcal{A} \times_n u$

Let \mathcal{A} be a tensor of size $I_1 \times I_2 \times \dots \times I_N$, U be a matrix of size $J_n \times I_n$.

We have:

$$\begin{aligned}
ttm(\mathcal{A}, \{U\}, [n]) &= (\mathcal{A} \times_n U)(i_1, \dots, i_{n-1}, j_n, i_{n+1}, \dots, i_N) \\
&\quad \sum_{i_n=1}^{I_n} \mathcal{A}(i_1, i_2, \dots, i_N) U(j_n, i_n) \\
like : X &= tensor(rand(5, 3, 4, 2)); A = rand(4, 5);
\end{aligned} \tag{166}$$

$$Y = ttm(X, A, 1) = ttm(X, \{A, B, C, D\}, 1) = ttm(X, A', 1, 't')$$

Matrix Interpretation

$$\begin{aligned}
ttm(A_{m \times n}, \{U_{m \times k}^T\}, [1]) &= A \times_1 U^T = U^T A \\
ttm(A_{m \times n}, \{V_{m \times k}^T\}, [2]) &= A \times_2 V^T = AV \\
ttm(A, \{U, V\}, [1, 2]) &= UAV^T
\end{aligned} \tag{167}$$

$$Y = ttm(X, A, B, C, D, [1234]); \% < - - 4 - waymutlply.$$

$$Y = ttm(X, D, C, B, A, [4321]); \% < - - Sameasabove.$$

$$Y = ttm(X, A, B, C, D); \% < - - Sameasabove.$$

$$Y = ttm(X, A', B', C', D', 't'); \% < - - Sameasabove.$$

$$Y = ttm(X, C, D, [34]); \% < - - XtimesCinmode - 3Dinmode - 4 \quad (168)$$

$$Y = ttm(X, A, B, C, D, [34]); \% < - - Sameasabove.$$

$$Y = ttm(X, A, B, D, [124]); \% < - - 3 - waymultiply.$$

$$Y = ttm(X, A, B, C, D, [124]); \% < - - Sameasabove.$$

$$Y = ttm(X, A, B, D, -3); \% < - - Sameasabove.$$

$$Y = ttm(X, A, B, C, D, -3); \% < - - Sameasabove.$$

Property

$$\begin{aligned} ttm(\mathcal{A}, \{u, v\}, [m, n]) &= \mathcal{A} \times_m u \bar{\times}_n v \\ &= ttm(ttm(\mathcal{A}, \{u\}, [m]), \{v\}, [n]) = (\mathcal{A} \times_m u) \times_n v \\ &= ttm(ttm(\mathcal{A}, \{v\}, [v]), \{u\}, [m]) = (\mathcal{A} \times_n v) \times_m u \end{aligned} \quad (169)$$

C. Tensor times tensor (ttt): $\langle \mathcal{A}, \mathcal{B} \rangle$

Let \mathcal{A} and \mathcal{B} be a tensor of size $I_1 \times I_2 \times \dots \times I_N$.

$$\begin{aligned} \langle \mathcal{A}, \mathcal{B} \rangle &= \\ \beta &= \sum_{i_1=1}^{I_1} \sum_{i_2=1}^{I_2} \dots \sum_{i_N=1}^{I_N} \mathcal{A}(i_1, i_2, \dots, i_N) \mathcal{B}(i_1, i_2, \dots, i_N) \end{aligned} \quad (170)$$

$$X = \text{tensor}(\text{rand}(4, 2, 3)); Y = \text{tensor}(\text{rand}(3, 4, 2));$$

$$Z = \text{ttt}(X, Y); \% < - - \text{Outerproduct of } X \text{ and } Y.$$

$$\text{size}(Z)$$

$$Z = \text{ttt}(X, X, 1 : 3) \% < - - \text{Innerproduct of } X \text{ with itself.}$$

(171)

$$Z = \text{ttt}(X, Y, [123], [231]) \% < - - \text{Innerproduct of } XY.$$

$$Z = \text{innerprod}(X, \text{permute}(Y, [231])) \% < - - \text{Same as above.}$$

$$Z = \text{ttt}(X, Y, [13], [21]) \% < - - \text{Product of } XY \text{ along specified dims.}$$

XI. model of helical duct

A. w

The duct is described by its centreline $\mathbf{q}(s)$ at arclength s from the inlet of the duct adn the radial distance from the centreline $h = h(s)$. The general position vector (x) in the duct is given in terms of (s, r, θ) :

$$\mathbf{x} = \mathbf{q}(s) + r \cos(\theta - \theta_0) \hat{\mathbf{n}} + r \sin(\theta - \theta_0) \hat{\mathbf{b}} \quad (172)$$

where $\hat{\mathbf{n}} = \hat{\mathbf{n}}(s)$ is the normal to the centreline and $\hat{\mathbf{b}} = \hat{\mathbf{b}}(s)$ id the binormal given by $\hat{\mathbf{b}} = \hat{\mathbf{t}} \times \hat{\mathbf{n}}$ for the tangent to the centreline $\hat{\mathbf{t}} = \hat{\mathbf{t}}(s)$. The vector $\hat{\mathbf{n}}, \hat{\mathbf{b}}$ and $\hat{\mathbf{t}}$ are related by the Frenet-Serret formulas:

$$\frac{d\hat{\mathbf{q}}}{ds} = \hat{\mathbf{t}}, \quad \frac{d\hat{\mathbf{t}}}{ds} = \kappa \hat{\mathbf{n}}, \quad \frac{d\hat{\mathbf{n}}}{ds} = -\kappa \hat{\mathbf{t}} + \tau \hat{\mathbf{b}}, \quad \frac{d\hat{\mathbf{b}}}{ds} = -\tau \hat{\mathbf{n}} \quad (173)$$

where $\kappa = \kappa(s)$ is the local curvature of the duct and $\tau = \text{tau}(s)$ is the torsion. Here, introduce

$\theta'_0 = \tau$, the cross-term differentials vanish and the metric reduces:

$$\begin{aligned}
d\mathbf{x} &= d(\mathbf{q}(s)) + d(r\cos(\theta - \theta_0)\hat{\mathbf{n}}) + d(r\sin(\theta - \theta_0)\hat{\mathbf{b}}) \\
&= \hat{\mathbf{t}}ds + drcos\phi\hat{\mathbf{n}} - r\hat{\mathbf{n}}sin\phi(d\theta - \tau ds) + rcos\phi(-\kappa\hat{\mathbf{t}} + \tau\hat{\mathbf{b}})ds \\
&\quad + drsin\phi\hat{\mathbf{b}} + r\hat{\mathbf{b}}cos\phi(d\theta - \tau ds) + rsin\phi(-\tau\hat{\mathbf{n}})ds \\
&= \hat{\mathbf{t}}(1 - \kappa rcos\phi)ds + \hat{\mathbf{n}}(drcos\phi - rsin\phi d\theta) + \hat{\mathbf{b}}(drsin\phi + rcos\phi d\theta)
\end{aligned} \tag{174}$$

Thus,

$$\begin{aligned}
d\mathbf{x} \cdot d\mathbf{x} &= (1 - \kappa rcos\phi)^2 ds^2 + (drcos\phi - rsin\phi d\theta)^2 + (drsin\phi + rcos\phi d\theta)^2 \\
&= (1 - \kappa rcos\phi)^2 ds^2 + dr^2 + r^2 d\theta^2
\end{aligned} \tag{175}$$

As a result, we have an orthogonal coordinate system and as such do not need to distinguish between covariant and contravariant bases.

XII. funm-Evaluate general matrix function

<https://ww2.mathworks.cn/help/matlab/ref/funm.html>

XIII. mtimesx-does a matrix multiply of two inputs

mtimesx is a fast general purpose matrix and scalar multiply routine that utilizes BLAS calls and custom code to perform the calculations. mtimesx also has extended support for n-Dimensional (nD, n > 2) arrays, treating these as arrays of 2D matrices for the purposes of matrix operations.

"Doesn't MATLAB already do this?" For 2D matrices, yes, it does. However, MATLAB does not always implement the most efficient algorithms for memory access, and MATLAB does not always take full advantage of symmetric cases. The mtimesx 'SPEED' mode attempts to do both of these to the fullest extent possible. For nD matrices, MATLAB does not have direct support for this. One is forced to write loops to accomplish the same thing that mtimesx can do faster.

Examples:

$$\begin{aligned}
C &= \text{mtimesx}(A, B) \% \text{perform the calculation } C = A * B \\
C &= \text{mtimesx}(A, 'T', B) \% \text{perform the calculation } C = A.' * B \\
C &= \text{mtimesx}(A, B, 'G') \% \text{perform the calculation } C = A * conj(B) \\
C &= \text{mtimesx}(A, 'C', B, 'C') \% \text{perform the calculation } C = A.' * B'
\end{aligned} \tag{176}$$
